Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity,

attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996.

ICOM

R-10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat

250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Rugged construction. External power supply. DB25 RS232C connector. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997.

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency

of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of

preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat

BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT

Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz

band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked | out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004

Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. Watch for review by Bob Parnass in future issue of Monitoring Times magazine.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission. See September 1996 Monitoring Times for modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider

frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner

crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a | beautiful 8-1/2" by 11" scaled color map, protected by | plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by

the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals,

weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" |
This article answers the question in various sections: |

Books |
Magazines |
Government Records |
Web Sites |
Federal Radio Stations |
Radio Clubs |
Do Your Own Sleuthing |
What Makes Station Identification Difficult? |
Examine the FCC License on Premise |
Examine the Labels on Radio Equipment |
Equipment to Determine Frequency Usage |
How Can I Determine To Whom I'm Listening? - An Example |
Summary |
Addresses |

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call Plus is |

basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is expected soon and will be available from Grove Enterprises for about $30. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from | members of the Radio Communications Monitoring Association | (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's

book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications | magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. *

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains | a handful of fields for every FCC license in the US.

However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including | a beautiful 8-1/2" by 11" scaled color map, protected by | plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. Rich Barron maintains an interesting site at www.exo.com/~rbarron.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the

FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page | http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or

anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the

channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a

receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to
him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the
"instructors". Mystery solved; I had been monitoring the
customer training center for a large computer manufacturer.
The training center has hotel rooms and dining facilities
to accommodate students from out of state. As a
convenience, shuttle van service is provided to local
shopping malls.

Summary

Through books, government records, and radio clubs, scanner
listeners can make use of frequency information compiled by
others. Two-way radio users often fail to identify their
transmissions properly, making it more difficult for
listeners to know who they are monitoring. By examining
radio equipment labeling, and monitoring and taping
transmissions, scanner enthusiasts can unearth new
information.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation is able to effect | repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 11915 E. Washington | St., Cumberland, IN 46229. Phone 317-894-3229.

To order a user manual for an Electra/Bearcat scanner from | Uniden, call (800)235-3874 extension 2553.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know

if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold.

That's an attempt to limit the current drain on weak NiCds
to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board,
adjacent to the black multi-pin connector which mates the
Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily,
by something in the scanner drawing too much current
through it. In one case, capacitor C36 shorted. It's a 220
uF 10v electrolytic, located on the component side of the
main board, connected from pin 8 of the audio IC (IC2
NJM386SL) to ground. Capacitor C55 shorted in another
BC200XLT. In a pinch you bypass Q201 by soldering a short
piece of bare wire between the collector and emitter, but
you must first fix the component which caused Q201 to fail.

Other Problems

Complaints of low audio output and occasional microphonics
in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd
electrolytic capacitor in series between the external
speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder
connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier
activated relay inside the BC890XLT wore out. Andy found
the identical relay sold at Radio Shack (part #275-232) and
says the BC9000XLT uses the same relay, too.

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are

suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s are use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier

activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal
Signal in University Park, IL, phone (800)524-3021. You
can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone
(800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 5A95, means the scanner was made in the 5th month of
1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Schematics, Owner's Manuals, and Parts Available

Service manuals for most Radio Shack scanners may be
ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a
Photophacts from Howard Sams Publishing division of

Prentice-Hall at (800)428-7267.

Parts may be ordered through your local Radio Shack store
or through Tandy National Parts, telephone (800)442-2425.

G & G Communications (telephone (716)768-8151) is a family
owned company which repairs scanners and stocks parts for
several older models, especially Electra/Bearcat and
Regency brands, but they don't sell manuals or schematics.
They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022,
PRO-2004, and PRO-2005/6 is implemented by an
electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is
designated EL-501, and is identified by Radio Shack part
#10800050. A new EL panel can be ordered through your
local Radio Shack store and sent to your home for about $12
plus shipping. Radio Shack no longer sells replacement EL
panels for the PRO-2004.

Replacing the backlight is an operation which requires care
and patience. The service manual has an exploded parts
diagram which is helpful in showing how to disassemble the
scanner.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables,
e.g., PRO-39 and PRO-43, can become unreliable after
prolonged use. The best repair is to replace the rubber
keypad instead of trying to restore contacts using
chemicals. A replacement rubber keypad may be ordered
through your local Radio Shack Store for about $4.00.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part
#EAS-3P123A). The voice coils in some of these speakers
have opened, resulting in lack of audio output, though
audio is still available from the earphone jack. A more
capable 500 mW speaker is available through Tandy as
replacement (EAS-3P127).

Is a bit frustrating isn't it? Don't know who, in their infinite
wisdom, decided to force this upon us users. From what I've
heard, the delay is still there, but is now 1 second.

Perhaps an MVT-9000 owner would care to comment?

Strong signals,

Is there any way I can enter frequencies between 200 & 300 Mhz? The adms software will not let me , but I can manually enter them through the key pad and save them to memory.

Jim

A wireless mike is a small transmitter commonly used by police for undercover ops. The transmitter is connected to a small microphone that recieves the signal. The mic sends the signal to the transmitter via a small wire, and the transmitter sends the signal via air frequency to the other units with portables or scanners. Wireless mics are very low power, usually a range of about 2 miles at the most. Hope this helps.

Did you use a lot of four-letter words in your responses to them? I
wouldn't blame you if you did. I always knew that a small number of
scanner listeners did some stupid things, but this one has to top them all.

>them, re-wiring the unit, etc.

Well, lets see. A 7 AH gell cell 12 volt battery costs about $20,
and lasts about 6 years in normal use. So your battery needs to
last 30 years to reach breakeven on cost. And that's a battery
from a reputable company, not junk. What company supplies your
batteries? And exactly what chemistry do they use?

>And don't forget to try and charge your Gel-Cell from your car socket!
>I want to see that trick, but from a distance.

Why? I charge my gell cells from the cigarette lighter socket. I use
a taillight bulb in series to avoid blowing the cigarette lighter
socket fuse if the battery is really flat (doubles as a handy charge
indicator too). There is no hazard.

> The NiCad "memory effect" I mention has been the bane and the
>heartache of millions of users of NiCad powered devices, including
>aviation radios, cel-phones, laptop computers, and I believe all kinds
>of amateur radios. Whatever the technical name for this problem is, it
>exists and it is a major concern of most users of these devices. This
>is why the Lithium Ion, Nickel Metal Hydride, and other technologies
>were developed. These new batteries have advantages and disadvantages
>too.

The NiCad memory effect requires extremely unusual conditions to
produce. To generate it, you have to discharge the cells to *exactly*
the same state of charge *every* time for several hundred times. It was
first noted in a satellite application where the battery was cycled very
precisely by the orbital dynamics. The solution to this problem is very
simple, don't discharge your battery to the same level *every* time
before recharging.

The problem most users of NiCads have is entirely different. It is a
condition called voltage depression, and is the result of *overcharging*
the battery. Don't do that, not even just a little bit, use a proper charger
which senses charge state and shuts off before overcharging can occur.
I have a number of NiCads with 1970s date codes which are still giving good
service. Of course they've never been abusively overcharged. Gell cells aren't
subject to this malady, though they shouldn't be floated indefinitely or
they'll sulphate.

> My product is a very useful item that offers the most user friendly
>characteristics, is of the best quality, and lasts the longest. If this
>is of no interest to the readers of this newsgroup then I apologize and
>I overestimated their need for good quality products. But I do not
>believe this is true and I will wait to see if the majority of this
>group agrees.

Well, lets just say we're skeptical. If your claims have no more substance
than your claims about the deficits of the competition, why should we believe
your battery is better? Tell us the manufacturer of the battery, and tell
us its chemistry. Then we can decide if your product is worth 5 times the
going rate for a similar product. (I'll grant you that the pouch, sockets,
and cord add *some* extra value to the battery you're selling, but not $100
worth of extra value.)

>the hams. :(

You have a definite point about the ham bands. As for the ARRL opposing
a scanner law, why would they? It has nothing to do with ham radio. I
would think that any law like the one I speculated about would include a
grandfather clause for existing ham transceivers (using them to listen
to police, fire, etc. would still be illega, of course)

> You also forgot to mention how they planned to reimburse the scanner users

Reimburse "technocreeps" for turning in their "electronic stalking"
equipment? I wouldn't count on it.

My question is more of an advice seeking type. I would like to know if anyone can suggest a very good base scanner antenna for receiving distant weak signals in the freq.range of 160-161mhz. I have been experimenting with different models by cutting them to 16" and have gotten some improvement but hoped there is an antenna more suited to these freqs.out there on the market.

Thanks for any help you can provide.

I think that you and the guy who posted the original idiotic comment about the PSA calls are both nuts. Since when don't you want as much information as possible about where a major incident may be about to begin? Are you trying to tell me that you actually got a caller who said, "A commercial airliner just crashed at 11234 Somewhere Street, between Cross Street and Traveling Avenue?" Give me a break...

I have a lot of years in central dispatching myself, and I think your attitude about not wanting to be bothered with multiple calls on an incident indicates poor training.

New Scanner World catalog- Beartracker BCT-7 $199.99.
This is sold for $170 at truckstops all over. And tstops are notoriously high priced!
PLUS they say this is the Package Deal price. And list the stuff included in their package deal. All the stuff u GET ALREADY from Uniden.
What a rip.

don't make much sense. Once the victim is IN there is really not
much reason for any scanner traffic.

Then it becomes Hospital Business, which is private.

If the cops go as escort, sometimes they announce it if it has
to do with the incident's integrity. But rarely....

Best thing is that the head nurse is called for that fllor annd
info given or not. Or there is a person who is the community
relations officer and he or she has that info to give out.

IT's done by Calling the Hospital by phone...inquiring for details.

That is how the Press gets their info and anyone else. Unless you
go to the hospital and inquire at desk?

>
>Thanks for any help you can provide.
>William G. Brown

There are several suggestions. your 16" antenna is a quarter wave, which is basically a non-gain antenna. I'd suggest an antenna with more gain. First thing that comes to mind is the Grove Scanner Beam, a directional antenna that can be turned with a small TV antenna rotor. You can also make your own log periodic or yagi style beam by doing some modifications to that TV/FM antenna sitting on the roof. I've had fair results just by turning the thing on it's side so the elements are vertical rather than horizontal, putting a 300 to 75 ohm balun on the feedline connection, run some RG-6 coax down to the scanner and voila!

You can also cut the elements to fit the band(s) of interest and space the elements properly, but that's not an absolute requirement, it only helps bring in real weak signals by bringing the elements into resonance. Keep in mind we're talking receive only here.

Now if all that sounds too involved or whatever, there are some other choices available. If you can locate one of those Antenna Specialists 5/8 vertical base loaded 2-way radio antennas, you can cut the steel whip for the frequency of interest, mount it on a plate, add some ground radials and presto, instant 3 db gain antenna!

More gain can be had by going with a co-linear antenna, which run more gain than the above 5/8 antenna. These also make nice single band gain antennas.

My suggestion is if the signals are very weak, go with the beam antenna, you can zero in on the signal and get maximum gain.

Hope that helps!

Happy scanning,

Jon

Here, here! I rode as an observer and never told the officer I had a scanner. If he mentioned something I knew about, I'd just nod my head but not explain my reaction (and he didn't ask). I'm glad I didn't say anything. I definitely don't want it broacasted to the cops (ng different) that I have one. I heard an officer say once to another: "This guy has a scanner. We'll go toward his place later but I'll call you on your cell phone so he doesn't know we're on our way." I hear of those other women who are "police groupies." No thank you (I have a husband I love and a life)! We have a scanner because we enjoy listening. We listen to it like we would a regular radio.

The dispatchers with our PD do an excellent job. They deserve plenty of respect as do all dispatchers.

A little too simplistic I'm afraid - but it will work in most cases.
There are cases where there are additional offsets in the 'freq code'
that skip over blocks of instructions like '30B' (hex).

.. which will, as a private citizen, get you absolutely nowhere.

Try this: Call the emergency department of your local hospital after you hear that a patient has been transported, and a sufficient period of time has elapsed. (Say, six hours or so.) Ask the person who answers the phone about the status of that patient, "Oh, the chest pain that was brought in - how is he?" I can guarantee that you'll be told to fuck off and asked not to call the hospital with that kind of request again. And that's the polite way.

Among the most fundamental tenants of medicine is the patient's expectation to privacy. The wards and units DO NOT COMMENT ABOUT A PATIENT'S STATUS OVER THE PHONE, EVER. Family members are told vague details ("he's doing better today") when they call. (If we called, it's another story altogether.)

The public affairs office neither has access to nor will disclose information regarding patients and outcomes. Anything that gets released to the press is done by the mutual consent of the family and the persons involved. We will not release information concerning any patient no matter how hard you pester us. Doing so would put us in a position of violating a major ethic, and will probably get us hauled in front of a disciplinary committee, something that I personally try to avoid. (I can't comment on other people in the medical professions, but I'd guess that most of them have an aversion to DC meetings.)

What happens inside the hospital is none of your business, because that is private property. Do yourself a favour, do us a favour, spare your ears some insult, and don't ask stupid questions that we can't answer.

> NOW what should be outlawed?

They looked at something like 600 accidents and made their "determination" by counting cellphones in cars. There was no consideration of whether or not the driver was actually on the phone at the time of the accident. The "report" also claimed that handsfree cellphone are just as dangerous.

I could look at any 600 car accidents and find it more likely that a "mechanical" problem... like a loose nut behind the wheel.

I think somebody has an anti carphone agenda.

> The truth as I perceive it to be.

You can be fooled by the length of the antenna. Many UHF 600s have
longer antennas.

The easiest way is to look at the model number. The third place in the
model number will tell you the band. H33 = VHF hi band, H34 = UHF.
This holds true for just about all Motorola model numbers.

1 HF
2 VHF lo
3 VHF hi*
4 UHF *
5 800-900

* Other parts of the model number will tell you more about the range
within the band. Eg: Some UHF units might be for 430 to 470 while
others are for 470 to 512.

Regards

You probably won't get much help at RS for crystals for older Bearcat Scanners. They were the only scanner that did not use the 'universal' 10.7 IF in their radios. As I remember, Bearcat used 11.4 IF. The RS crystals can be ued, but they don't receive on the frequency marked on the crystal, due to the different IF frequency of the radio. Contact one of the crystal companies.

174 to 216MHz are TV channels 7 through 13. That's why scanners aren't
programmed for those frequencies.

I have one of these models myself, I just removed the back cover where the battery pack is stored, I found a small button between the two top screws, this may be a reset button (not mentioned in the handbook). I haven't tried it, don't want to spend the time reprograming 100 channels.

I dunno about that. For every encryption method there is a software program to decrypt it. I see no reason why a court order when needed can't allow the necessary authorities the authority to listen in on a suspected criminal's conversations just the same way this is allowed on the twisted pair. You're thinking of the "clipper chip" debacle way back. This is slightly different, I think.

Can someone please help me with a problem that I am having
with my hand held scanner? When I try to scan from Perceive
or Picture Publisher, It does not reconise my scanner.
It comes back SPI DRIVE OPEN FAILURE. Does anyone know what
this means and what I can do to correct it? I have searched
through all the manuals that I have and can't find anything
about this problem. I will very much appreciate any help that
you can give me. Thank you, Kay

Jt> told me the FCC considers modifying a type of manufacturing,

Wow!!! They better hire a few thousand employees to search for all
the modified computers. Just think, if you replace that 2400 modem
that came free with your super-duper P5 with a 33.6K modem, you've
modified a type-accepted electronic devise. Or replace the 540meg
HD with a gigabyte HD and you've modified a type-accepted devise.

Will the FCC go after every TV repairman who at some time substitued
a 6BK7 RF amp with a 6BQ7 or 6BZ7, or a 1B3 HV rectifier with a 1G3?

Source record: 207549

You are legally allowed to listen to anything your scanner is designed to pick up from the air.
It is not illegal to listen to cellphones or cordless phones as long as it is randomly received.
It is not legal to target a specific person or persons for scanning.
Example: it is legal to pick up random conversations but if you wanted to listen to a specific person and found a way to listen to this person on purpose, this is not legal. You are not allowed to specifically choose a target and listen to them. As long as you are picking up random conversations it is legal.
A court case precedence has already been set on this issue concerning a lady who picked up a cell phone conversation about a murder plot. Enough information was exchanged so that the lady who was listening was able to tell police who the people were. The lady was never charged with an illegal act because the decision was that she was not intending to listen in on purpose to these people's conversation. The conversation was picked up randomly while scanning.

I use a thing called the "RACE-TENNA" which I got for scanning at NASCAR races.
It's barely 2" tall and cost me $12.00 from Frequency Fan Club.1-800-RACE-FAN.
I *go
I *got* it for race track use but turns out that it's also a super all around
small size antenna. It works great for places like the mall or amusement park
type of situations where a small descrete antenna comes in handy.
Has BNC type connector.

In article <3303F0D4.7F4E@infinet.com>, Stephen Hall <schall@infinet.com> says:

>LOOSE means near undone, not tight, loose fitting....
>There is no word "LOOSING" in any american english dictionary

...and loosing, according to Funk & Wagnall's Standard College
Dictionary means, 'to set free, as from bondage, penalty, obligation,
etc.', along with seven other usages.
By the way, 'English' requires a capital.
By 'american' (sic) do you mean the Americas--Northern, Central, and
South, respectively--or do you mean the United States of? There are
several varieties of English spoken in the Americas, which your limited
dictionary might not cover (Webster's, right?).

Language is like a loose thread on a sweater, or a scab--pick at it
and you may be sorry. :-)

"ok", nothing.
This is an essay question. One sentence (with capitalization and
punctuation errors, yet) simply isn't "ok".
There is nothing to let the reader know what to expect, no
development of the central theme, no adequate closing.
Worse, there is absolutely no evidence of any research into
the subject (how do we know it's really a test?).
I feel cheated as a reader of this post, and an author
should *NEVER* leave his/her audience feeling cheated.

I give it a B+ at very best.

<C>ontinuous <T>one <C>ontrolled <S>quelch <S>ystem.
On many commercial frequencies, there are many users sharing the same freq.
So that each user can hear only those transmissions that belong to that user, CTCSS is used.
Each transmission is accopmanied by a tone (too low in freq to be output by the speaker). Each user has its own specific tone. Each user's radio(s) are equipped with a CTCSS system that will allow the squelch to open *when that particular* tome is transmitted with the signal.
This way, each user can access the system, and still hear only the messages for that particular system.
The transmitters are usually smart enough to allow transmitting only when the freq is clear (to avoid multiple transmissions at one time).
Hope this helps.

Bill

Dragon,
Wireless mics are those that are not connected to an amplifier/speaker
by direct connection, but by radio.
Though they are in use by fast food chains, the best example is the
equipment used by football referees to explain the penalties.

Tom Van Cura wrote:
>
> I see ads for ctcss decoder on a scanner.What is this used for? Thanks
CTCSS is a subaudible tone transmitted by a radio to "open" the squelch
of other radios in the same group.
For instance, if three different ambulance systems are operating on the
same frequencies, and have 3 different ctcss codes, and the radios are
in ctcss mode, they will only hear their own units. This system does not
allow multiple transmissions at the same time, and in fact, most ctcss
equipped radios have a "monitor" button that should be pressed to see if
anyone else is transmitting before you do. This was originally marketed
by Motorola as "PL" or "Private Line", a misnomer since anyone with a
scanner could hear all the conversations, but the ctcss equipped radios
would only hear their own group.
In my area, a school bus service is on the same frequency as the local
ambulance service. If I were to modify my scanner to lock into certain
ctcss tones, I could choose to have the scanner skip the bus company,
but stop on the ambulance transmissions

Where the hell are John, Andy, Ron, Peter and the rest of the whiners
pack when these blatant advertisements show up here. It is hard to =
believe
they could spend months harassing another user for commercial posts
and then let this crap go by.

BTW, you can find similar products for half the price at a number of =
different
retail outlets. Or you can just purchase a power cord for your HT, a =
nylon
camera bag and a $20 12volt 7amp gel cell that will run your HT all day. =
When
the day is over throw it on the automotive 12V charger. Oh yea William, =
my
gel cell has been in service for over 6 years now both for HT power and =
in
my RC airplane hobby. No memory (your lie) either. $129...what a scam! =

The Motorola MDC4800 MDT's do not use encryption, they use 20 year old ecoding methods, and use plain ASCII.

Cheers

>
>http://www.mich.com/~eddy/works/AR8000Tips.html
>
>Hope this helps, Steve

Steve,

Did you put in a faster CPU quartz crystal resonator when you did the mod?
I put in a 4.915 Mhz crystal, which increases scanning and searching speed
by about 18%, while admittedly still not a turbo-scanner, it helps and
eliminates the wandering birdie problem.

I also did the audio clipping mod, it helps considerably on AM aero
signals and supposedly on cellular, which of course I don't listen to <G>
It ain't an easy mod though.

I concur with your observations, these mods shouldn't be necessary for the
money, but it's still the best handheld legally available in the US. Think
this one scans slowly? Try the Icom R-10, it scans so slow, you could go
to lunch and hang out for martinis before that snail completes a scan

cycle.

There is one other problem, you can't leave the batteries in while on external power. AOR should be tarred and feathered for the ommission of separate charge and power jacks, or at least a switch. When I plug the scanner into external power, I remove one battery unless I want to charge them.

I don't agree with the difficulty posted by some people about linking banks. It's a piece of cake, takes me a couple of seconds max to link any bank.

Someone remarked it acts flaky when running batteries on the computer interface. Which interface? There are several, and I've never had any problems with mine on batteries.

My $.02 worth.

Happy scanning!

Jon

Let's see, here we have "misplaced" and "misplacing" misspelled,
incorrect use of ellipsis, lack of capitalization of American and
English, and no periods at the end of the sentences. Not bad for a
spelling flame.

You're right about the misuse of the word "loose," though. That
drives me crazy too.

It is not my intention to be rude *but* when you criticize other
peoples spelling and grammar, you become fair game yourself.

My Webster's New Collegiate Dictionary says that there *is* such a word
as "LOOSING":

loose vb loosed; loosing vt 1 a : to let loose : RELEASE...

That would be real good. Change the "non-emergency calls" number to something unlisted so that people who do want to report something important (say, to add to a report that was called in earlier but is no longer an emergency) now can't use it. That's rediculous.

Ah, but this assumes that every cell phone user is also a scanner buff.
Me thinks the opposite is true -- that most cell phone users aren't
scannists as well. Thus, that won't work. :(

How does the in flight radios work on the major airlines?

I was on a flight yesterday, and the "tuner" on my seat
was screwed up, and it sounded like it was off freqency
and had lost it's antenna - lots of static, and what did come in
sounded off.

Just curious - any way to pick up the programming with a scanner?
(if it was legal to use it on the plane)

Thanks!

1860. Does the cell phone companys have a deed to 800mHz airwaves?

Newsgroup: rec.radio.scanner

I think not.
This cell phone thing reminds me of the early days
of satellite tv. HBO and others were in the clear. They got mad
because people could watch for free. Since they didn't own
the airwaves the only thing they could do was scramble. And so
they did.
The only way to make a call over the airwaves private is digital
or other scrambling method. This goes for cordless as well as
cellular.
The true crime is the cell companys giving customers a false security
about cell phones. The average joe does not realize its just a radio
linked to the phone lines.

Guess I will say this and more in letter to my congressman.

Charley

Subject: Re: cell phones and ECPA
Organization: ACM Network Services

curious@here.now asked:
> What is the true story on cell scanning. I have heard that:
> 1. It is illegal to sell scanners that receive cell freqs.
> 2. It is illegal to scan cell freqs.
> 3. It is illegal to divulge what one hears on cell freqs.
> I tend to think that # 1 and #3 are true. but is #2?
> Has anyone who knows what is what read the ECPA and understand it?

The questions keep coming up, different laws are mentioned, and most
replies are of the form "I'll do anything I bloody well please and no law
can stop me". The following is a short disertation on the various laws and
their effect.

The laws of the United States, passed by Congress, are codified as the
United States Code (USC). It is divided into titles covering various subjects.
Title 18 includes the criminal laws and penalties; Title 47 covers
telecommunications. A law can be refered to by its original name (i.e. "The
Communication Act of 1934") or its entry in the USC. A specific section
would be refered to by title/USC/part/section, i.e. 47 USC 605.
To carry out the law, the various government agencies create regulations,
which are codified as the Code of Federal Regulations (CFR). It is likewise
divided into titles, with the FCC's rules in 47 CFR.

18 USC 119 bars the disclosure of any electronic communications to
which you are not a party (with certain legal exceptions), and sets the
penalties. 47 USC 605 (the Communications Act of 1934) also bans the
disclosure or use of third-party communications. With minor changes, this
has been the law for 60 years.

In 1986 Congress passed the Electronic Communications Privacy Act (the
ECPA), which added definitions to the law that banned listening to cellular
telephones. It also banned the monitoring of broadcast auxiliary, SCA and
scrambled signals.

In 1992 Congress passed the Telephone Disclosure and Dispute Resolution Act (TDDRA), which instructed the FCC to ban the manufacture or import of scanners capable of receiving cellular. In accordance with this law, the FCC modified 47 CFR Parts 2 & 15, effective 26 April 1993. Note that this does not affect the sale of such scanners, so long as they were made or imported before the cutoff date. It also does not bar individuals from modifying their receivers.

On 25 Oct 94, the Digital Telephony act was signed. Buried in one of the additional sections was a change to 18 USC 2510 & 2511 that added cordless phones to the original ECPA ban on receiving cellular.

In short:
It is illegal to manufacture or import cellular-capable scanners.
It is illegal to listen to cellular (and cordless) transmissions.
It is illegal to divulge any communication to which you are not a party.

Now, please - we all know the first two are: 1) stupid; 2) unenforceable; and 3) widely ignored. It is not really necessary to post the obvious to the whole world (unless you have an irresistable urge to demonstrate even less sense than the legislators who enacted them).

Why don't you print or save this info in case you need it in the future?

Hello Friends,
It's time to take full advantage of the online medium by having your photographs scanned today! Once your pictures are scanned into one of three formats (GIF, JPEG, or BMP) you can do many exciting things with them.

-You'll easily be able to attach them to emails and send them to people your chatting with online. No more having to try and explain what you look like!

-You can also use your photos in all kinds of fun projects: build web pages; design your own greeting cards; make personalized stationary,desktops, and screen savers- the list is endless!

- Scan pictures of yourself, your pet, your vacation, or whatever you choose!

Cyber Services will scan ANY photograph, drawing, magazine clipping, or other artwork to an image file, and email or US mail it (on disk) back to you within 24 hours of its receipt. (You must be able to receive file attachments to get your file(s) via email. Check with your ISP if your not sure.) PRIVACY & CONFIDENTIALITY ARE ASSURED. You'll also receive helpful technical tips on everything from renaming your file to saving time when sending it to people via email.

We scan all our images in 16.7 million colors for best quality. For just $1 extra we can enlarge or crop your photo, blur out a body part, or ad text (such as your name or email address).

Best of all, as a FREE GIFT to you (limited time only), IF YOU CHOOSE TO, we'll reserve you a FREE PAGE (or pages) in our "Internet Date-Site" (Now under construction!!!). This web site contains pages classified by local area and sexual preference. There's also a erotic image gallery (must be legal age to enter), and a "special interests" section. That's right, you can have your own page on the internet for just $4! (Note: You're responsible for answering your dog's email!) Your free page(s) will include any or all of the following: Your scanned photo(s) (You pick which ones- You can have some, none or all of your photos posted on your page), your email address with an icon visitors can click to send you mail, and a brief profile about you. We'll remove or modify your page, at your request, at anytime! When the "Date-Site" opens for business, you'll receive an email notifying you of the address of your personal web page. You can give the address to people and they can view it from any internet
connection! There are millions and millions of people on the internet.It's

time you start meeting them! (This service won't be free for long so act now!)

If you have any questions regarding our services, please call us at (541)744-5718.

Ordering Information:

Price: $4 for first scan, $3 for each additional scan
Extras: $1 each to add personalized information. (name/email)
$1 each to have image modified (enlarged, body part blurred, etc..)
$2 to have image files mailed to you on a floppy disk (IBM or MAC).
$1 credit card processing fee (Visa/Mastercard users only)

If you would like your photographs returned to you please include a self addressed stamped envelope. Otherwise they will be destroyed.

Order Form (PRINT OUT or COPY CLEARLY):

Name (optional):

Email Address or Screen name (PRINT CLEARLY! You must be able to receive file attachments. Otherwise include $2 for shipment on floppy disk.):

Address (optional unless having shipped on disk):

Phone number (optional):

File type (GIF, JPEG, or BMP. GIF recommended):

Extras (Exact personalized info you want printed on scan):

Disk Format (if having mailed on a floppy): IBM or MAC

Payment method (Cash, Check, Money Order, or Visa/Mastercard):
Please make checks payable to Cyber Services.

Credit Card # (credit card orders only):

Expiration date:
Don't forget to include the $1 processing fee if your paying with your credit card.

Do you want the FREE GIFT? Yes or No (circle one)
-Web Page(s) in our "Internet Date-Site" (under construction). You can have a page for yourself, a page for your car, and a page for your cat! Be sure to indicate where you want your page (F4M, M4F, F4F, F4M, or Couples) and which of the following info you want on your page (print clearly): State and Town, email address, year or birth, physical description, quote/message (under 30 words please). Please indicate which photos you want on your page (if any) if you don't want them all to be displayed. If your want your nude/erotic photos displayed in our erotic image gallery YOU MUST include a signed statement that your are over 18 years of age or older and give us

consent to display your nude/erotic photo, and be sure to tell us if your want it displayed with your info or anonymously.

Mail the above information and photos with payment to:

Cyber Services
2852 Willamette St. #131
Department 1
Eugene, OR 97405

Orders sent overnight will be given first priority.

Erotic/Nude photo's will be accepted providing everyone in them is of legal age.

Questions? Call (541)744-5718

Please help our small business grow by sharing this info with someone you think could use it.

Thank You!

(cndEpR)

Hi,

Just get one unit of IC-R10 here in Europe. I wonder which "hidden"
functions it can support! I am quite sure that there are some not
explained in the manual. It looks like that some functions are supported
only via a "cloning link and SW". So far I've discovered a nice
schematics of the adapter as well as a SW for download on the ICOM's WEB
in Japan, but all is in Japanese... For the schematics of the adapter it
is O.K. but for the SW ......

Anybody discovered already some more functions and features?

Anybody has got the right SW?

Thanks, Brgds,

Ivo

IT's a great radio. For the freq range it offers. But
then too 800 and 900 were not in vogue then.

By the way...the charing circuit has a tendency to burn
out...not work. It comes with it's own charger inside.
you just stick it in the wall and up it charges. OR you
can use alkalines...they don't recommend nicads.

I still have the owner's manual and the scanner...but
again, the charging circuit is kaput...the bane of
this scanner.

It still works with alkalines and to hell with their
advice> I tried nicads and they seem to work fine...

From the FAQ "Introduction to Scanning"

[...]

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, | transmit either CTCSS or DCS signals subaudibly along with | the voice information.

There are over 40 different CTCSS codes and you can program | a specific CTCSS or DCS code into each memory channel. * Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers | and other signals which are not transmitted with a | matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and

some local police agencies employ digital voice
scrambling, which sounds like white noise and is |
annoying to hear. The CTCSS or DCS code is sent only
when the station is transmitting unscrambled, or "in
the clear." You can program federal frequencies
along with the proper code into your decoder-equipped
scanner so you won't have to listen to the scrambled
mess and only hear their transmissions when they are
unscrambled.

CTCSS also goes by various tradenames: Motorola's PL |
(Private Line), GE's Channel Guard, and RCA's Quiet |
Channel. Motorola uses the tradename DPL (Digital Private |
Line) for its digital coded squelch.

Tom:

All you have to do is place the radio in MANUAL, and then press and hold the L/O key. After a few seconds, the L/O indicator will go out, and all of your channels should be unlocked. It's been a long time since I worked with one of these, but I think there may also be a confirmation beep when all channels become unlocked.

From reponses I've got via email, it sounds like eavesdropping on a
conversation on a digital 900 Mhz phone is very difficult so I won't
worry about it.

BTW, why weren't digital 49 Mhz phones ever produced?

>this means? Is it affiliated with news media, police, emergency freq or
>what?

Norm, You see, there is this guy named Mike.....who used to go out with this girl named amp. Ok, enough of the stupid humor already. Wireless Mikes (it should be mic...short for microphone) are used by singers at rock concerts and in TV studios or anywhere somebody needs a microphone without being attached to a cord that runs to the amplifier. I have a frequency listing that has TV broadcast channels 7 to 13 through the 174 to 214 Mhz band. There may be some wireless mic's in there, but I'm not sure where. If you want to listen to them, you'll have to be pretty close to hear them as they are low power devices.

If you mean a COMPUTER programmable scanner, that would probably be the
new ICOM R-10 scanner. If you mean the smallest scanner that you can
program frequencies via the keyboard, that would be the WELZ WS-1000
sold in the UK by Javiation:

http://www.demon.co.uk/javiation/index.html

Just click on the WELZ WS-1000 for complete info.

> >
> >John Ward

This is extremely interesting, considering two things:

The FCC has nothing to do with the ECPA; it neither wrote it nor
enforces it.
The rules the FCC *did* write concerning this specifically said that
such scanners were to be designed such that "... readily being
altered by the user to operate, ...) on cell frequencies was illegal.
Note, the chance was trhere to make such alterations (modifications)
illegal, but, instead, such alterations were instead to be difficult.

For the FCC to now say that they meant something else (when they
very specifically said no readily altered) just doesn't sound right.

I can't see how this could possibly be held up in court.
It just makes no sense.
(Of course, these are the FEDS I'm talking about, so I guess this
should be no surprise!)

There is *NO* law or ruling to say that a scanner modified to receive
cell phone frequencies is illegal, in the U.S., on a Federal level.
Unless you can quote one?

We have just entered the TWILIGHT ZONE and the
forces are being mobilized by the gestapo-like
FCC who now has authority to "seize" radios which
they deem not beneficient to the public good.

We have begun being as in China, where they are
not allowed to listen to radios either...anything
that says "democracy" and "individual rights"....

We have begun to be told what to listen to and
by whom...all for an industry that overcharges
for their services can now make us the criminals.
A case of the criminals crying "criminals" and
the FCC criminalizes their agenda.

One thing: notice over the next few months how
the NEWS media will not mention this nor take
a stand against it because of the fear of upsetting
the people who are "elected"....the media will not
want to upset the FCC people, who are not electd.

That is the point: we lose our rights when those that
hinder our ability to hear are not elected.

That should be the next change: they who tell us what we can or cannot do must be answereable to the majority.

Actually, the other side of the 154 Mhz transmission is around 35 Mhz.
Third harmonic of 35 Mhz is 105 Mhz. Given that the receiver at 105 Mhz was
a wide-band at 105.1, it should have no difficulty in capturing the signal
and demodulating the audio. (Audio deviation would now be at 3 times
original).

Thanks,
I've already had lots of help. My interface works great, just followed the recomendations in the original post..

The original MDTstuff was already posted here, and on alt... a couple months ago now. If anybody wants a copy, just email me.

Dejanews can always find this stuff if you let it by the first time.

Because you mentioned it though, I'll send you a copy.

1899. Re: Cellphones as Hazardous as Alcohol

Newsgroup: rec.radio.scanner
Date: 1997-02-15 00:00:00 UTC
From: wa9yhx@aol.com
Message-ID: <19970215165600.LAA18898@ladder01.news.aol.com>
Source record: 207339

As a law enforcement officer, I've handled several vehicle accidents where people admitted to me that they were using their car phones at the time of the collision. However, there is no required question or blank to be filled in asking the driver(s) if they were using car phones prior to/at the time of the collision. We can include the drivers' statements in the narrative explaining the above circumstances, but it is optional (at least in the Illinois Traffic Crash Report).

However, I know of two accidents, one in my town, and another a little further away, where the causing party (who was killed) was obseved by witnesses talking on their cell phone(s) at the time of the collision.

When are they going to prohibit the manufacture of certain cellular phones that now violate their own interpretation of what is legal to manufacture? There are models out there that can be used to monitor other customers' calls without any modification.

Now, if you carefully read the whole thing, you will see that it is
the FCC's expressed intention to seize modified scanners from THOSE
COMPANIES WHO ARE PROSECUTED FOR DOING MODS "ON A SUBSTANTIAL SCALE."
They are NOT saying that they will be invading our homes looking for
individually modified scanners!

I Have a Garrett GTA 1000 metal detector with three coils (5x10, 8.5, and 10") in like new condition. Paid over $600. It is worth at least $275-300. Interested in trading for good cell capable base unit. The Garrett is a computer controlled, LCD readout detector with detachable batt pack so you don't have to swing the weight of the pack. (makes a BIG diff). Was the best selling detector in the world. Also - extraordinary batt life. Uses 8 AAs, and you could prob hunt every day for over a month before they run down. Shipping with new duracells.

Message-ID: <19970215175101.MAA21657@ladder01.news.aol.com>
Source record: 207348

Actually, possession of a modified scanner, or one produced prior to April 26, 1994 that is cellular capable, is not illegal. Only the production, importation or the act of modification to receive cellular is illegal. I guess that means as long as you don't get caught in the act you're OK! Once you're finished and all the screws back in their proper spots (be sure to burn any written instructions you might have used), well, the scanner is still legal to own. Of course, you still can't USE those new frequencies . . . . . .

Is this ridiculous, or not. (BTW, I still stand by my position that cordless and cellular monitoring is ethically wrong and should be illegal, but that doesn't stop me from appreciating how ridiculous these laws - and their interpretations - have become.)

It's not illegal to sell a cellular-capable scanner. No where in the law does it say that. It says it is illegal to manufacture and import cellular-capable scanners and now they are interpreting it to include modifying scanners to receive cellular frequencies. It remains legal to own - and sell - cellular capable scanners. Just don't tune in those FORBIDDEN frequencies. (Sort of like owning a gun. It's OK to own one, just don't go around shooting people.) (Sort of like owning a baseball bat. It's OK to own one, just don't go around beating people with it.) (Sort of like owning a rock. It's OK to own one, just don't go around hitting people on the head with it.) Gets kinda silly, doesn't it?

The FCC only has the authority to seize scanners that are evidence of criminal activity, i.e., if a company advertises that it will perform cellular frequency restoration modifications and the FCC investigates and finds a number of scanners that have been modified or are in the process of being modified then it can seize those radios as evidence of a crime. They can also seize a scanner if they have reason to believe it is being used in the commission of a crime, i.e. monitoring cordless and cellular telephone conversations. Simple ownership of a cellular capable scanner is not a violation of law, nor is a modified scanner illegal.

BTW, I suppose a person who sends their scanner to someone to be modified could be guilty of solicitation.

In a recent article by the typical liberal rag, Congress was considering including soldering guns in the list of weapons that fall under the "assault weapon" category. As of February 19, it will be illegal to purchase a soldering gun at your local Rat Shack.

Sales Droids will also be handing out forms to be completed before purchasing the less dangerous soldering pencils that include a 5 day waiting period for everyone. A background check based on illegally obtained FBI files will ascertain if the applicant has purchased a scanner in the past and is considered to be knowledgable with a soldering iron. If this is the case, members of the ATF (damned jack booted thugs) (ooops!!! they're coming after me now!!!) will come to your residence and confiscate all of your solder and screwdrivers. (along with everything else)

GTE and the others have the technology to make all cell radios unmonitorable...they just don't want to spend the money to produce these better answers to the question we now see ... to hear or not be heard...that is the answer....

the government made the Auto Industry put Air BAgs in....
the government made the auto industry put Smog control in
the government made labelling cigarrettes a hazard mandatory
the governemnt made liquor seals mandatory
the governemnt made child molestors report to the local police upon release from prison.
the government made day care providers submit to a police check of who they are before.

the goverment did not make the Cell Industry make phones unhearable but made the public guilty for their omissions...get it.

we are now possible felons for possessing a radio that gets talk which the government could have made the cell phone industry put into the radio for public good.....

see, something is very fishy....who has been paid off and given
head to allow this to be forgotten....

>Dave, NF2G

you really don't unnerstand guvernment, do you?

we are gradually becoming as intolerant to our citiezens as
Russia was and the satellites they controlled.

The NEW usa government no longer has to prove to the world
how democratic we are and how our Bill of Rights is a sacrament
right up there with ol Jesse Helm's burial plot with a thousand
angels waiting for him.

the NEW usa guvernment will be out to protect...their position
and their jobs and their perks, just like the bureaucrats in Russia
did before they got elected out of office....

our NEW government is out to protect itself...not the people who
are the Constitution's beneficiaries...we are entering a new
millenium period of where those in power become the power...not
the people.

Vis a vis...FCC, DEA, Agriculture Dept, Bureau of Indian Affairs,
etc. They have nothing to do with the people...just in
perpetuating the titles given to them by impotent presidents for
pay-off.

Look at the RU-486 pill...FDA knows full well it works. After all
they have been using it in Europe for too many years and no problem
there. But because the I Ran For President Once (and may do again)
PaT Robertson and his ilk are behind the banishment of Ru-486 plus
the impotent catholic church.

Afraid that women will be given too much freedom to choose. Just as
with Scanners which are modifiable...too much freedom to hear.

similar instances, different players. But in the end the people
end up in jail for being able to make their own decisions on what
to hear or what to be planning on or not.

women with their yoni
men with their scanners
control what is heard and you control what is produced and by
the power of who...deems it so.

so many similes here...

Again, watch the movie, Fahrenheit 451 on Cable when you can. It
has all the explanations of what being told what you cannot hear
portends...eventually what you can or cannot read, but the new usa
government already has started doing that with the censorship of
books like HUCK Finn and Of Mice and Men and Catcher in the Rye
and even Amos And Andy....

seems the congress elected recently come from that Pat Robertson
army of saviours of the country for the bettermenet of Pat
Robertson or those other idiots who squeeze their eyes tightly to solve
the problems they invent.

Scanners modified will be outlawed. A mind modified will be outlawed. Is not one equal to the other. Then we will have the INTENT TO police....Brave New World coming to a neighborhood near you....

For Sale- scanner items. I wish to sell the above items I will take offers until Monday 2/17/97 10pm eastern time. You may email me with an offer for any or all the items below. I will give preference to someone who will purchase the whole lot. Highest bid received by above deadline will win. Email questions to ae826@leo.nmc.edu.

Here is what I would like:

$120 for the whole lot *I* pay shipping

$50 for Bearcat 300 you pay shipping
$50 for 800Mhz convertor you pay shipping
$20 for tape activator you pay shipping

Descriptions of above items appear below

Bearcat 300 scanner in good working condition $50 you pay shipping

Base scanner with 12V input for mobile use
Scans 10cps
50 channel memory in 5 banks
Service search
All the usual bands (no 800MHz)
Mobile mounting bracket included
Fluorescent display (hard to see in your car)

Good begining scanner. As a matter of fact, this was my first programmable scanner.

800MHz downconverter $50 you pay shipping

Similar to the GRE superconverter offered by Grove. Connects to the Motorola jack on the back of most older scanners including the Bearcat 300 above. I assume you could replace the Motorola with a BNC connector. The converter requires an external 12V power source (An old AC adapter works fine) and an external antenna (at one point I made a 4" 800MHz antenna out of a piece of coat hanger soldered to a Motorola male connector-very easy to do! I'd include it, but cant find it). This converter works by taking 800Mhz signals and converts it down by 382 Mhz. Any scanner that can tune the UHF-T band can hear most 800Mhz stuff (all scanners I can think of can tune this range).

Nitelogger tape recorder activator $20 you pay shipping

Connects to scanner audio jack and tape recorder mic and remote control jack. Will switch tape recorder on and off when audio is present on scanner.

I have used all of the above devices together at one time or another and they work well as a system!

The fact that the AOR scanner was not great, has nothing to do with Ace,
obviously. I bought an AOR1000XLT from them a couple of years ago and I was
happy with the service and the scanner.

1997

MANUFACTURING ILLEGAL SCANNERS
INCLUDES SCANNER MODIFICATION

It has come to our attention that entities are offering to modify scanning
receivers (scanners) in order to receive frequencies allocated to the
Domestic Public Cellular Radio Telecommunications Service. Such
modifications are not permitted under federal law and the Commission's
rules.

Scanners are radio receivers that can automatically switch between four or more frequencies anywhere in the frequency range of 30-960 MHz. On April 19,1993, the Commission adopted a Report and Order in ET Docket 93-1 amending Parts 2 and 15 of the FCC Rules to prohibit the manufacture and importation of scanners capable of receiving, or readily being altered to receive, frequencies allocated to the Cellular Radio Service. The Commission adopted these rules to implement Section 302(d) of the Communications Act of 1934, as amended (47 USC 302 (d)).

Scanning receivers are required by Section 15.101(a) of the FCC Rules to be certificated by the Commission. Section 15.121 states that scanning receivers, and frequency converters designed or marketed for use with scanning receivers, must be incapable of operating (tuning), or readily being altered by the user to operate, within the frequency bands allocated to the Domestic Public Cellular Radio Telecommunications Service. Scanners that are capable of "readily being altered by the user" include, but are not limited to: those for which the ability to receive cellular telephone frequencies can be added by clipping the leads of, or installing, a simple component, such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device. Scanners and frequency converters for use with scanners, must also be incapable of converting digital cellular frequencies to analog voice audio. Under Section 15.37(f), the manufacture or importation of scanning r eceivers, and frequency converters used with scanning receivers, that do not comply with Section 15.121 shall cease on or before April 26, 1994.

Manufacturing a scanner to receive cellular telephone frequencies is a violation of Section 302(d) of the Communications Act (47 USC. Section 302(d)) and Sections 15.37(f) and 15.121 of the Rules (47 CFR 15.37(f) and 15.121). The modification of scanners on a substantial scale to receive cellular frequencies will be considered to constitute manufacture of such equipment in violation of FCC Rules. Entities engaged in such activity are cautioned to cease advertising and/or performing any such activity immediately.

The Commission will vigorously take enforcement action against parties found to violate these rules. Willful or repeated violations may be subject to a monetary forfeiture of not more than $10,000 for each violation or each day of a continuing violation, except that the amount assessed for any continuing violation shall not exceed a total of $75,000. See 47 CFR 1.80(a). Further, pursuant to 47 U.S.C Section 510, such devices may be seized and forfeited to the United States.

Use of scanners by individuals to intercept and divulge or use beneficially wireless telephone conversations is subject to Section 705 of the Act. Other Federal and State statutes also apply in this area. For more information regarding the interception and divulgence of radio communications, see FCC FACT SHEET, "Interception and Divulgence of Radio Communications," dated January 1997, which can be obtained by calling the Public Service Division at 202-418-0200 or accessing it on the Commission Internet web site at http://www.fcc.gov/Consumer_Info.html/.

By the Chief, Office of Engineering and Technology

Additional questions concerning this notice may be addressed to Art Wall at 301-725-1585 (ext. 205), fax: (301) 344 2050, email: awall@fcc.gov.

Are you seriously saying you want less than 2 second delay?

Don't you like to hear the whole of a conversation rather than just a few
snatches from various different ones?

I always have my scanner set to 4 seconds delay.

Don,
There is a great book on radio direction finding.
It includes many do it yourself home projects.
It is called: ''Transmitter Hunting, Radio Direction Finding
Simplified" by Joseph D. Moell, K0ov, and
Thomas N. Curlee, WB6UZZ. It is a TAB Publication.
It is available through most Ham Radio outlets.
You can also order it by calling 1-800-822-8158.

The software has an intentional block to prevent 200-300MHz frequencies from being entered into memory....

SUPPOSEDLY, this is because the radio's oscillators would "go berserk" when receiving in this band....

I understand that these blocks (200-300MHz and cellular) are to keep the Feds happy...

I don't know how percon identifies them but in my area (suburban detroit) I have found MDT-like signals between 854 and 857 mhz. I say "MDT-like" because I have found 8 signals that sound exactly alike but only one of them would decode with the MDT program that is circulating. I have tried the supposed "national MDT freq." of 855.8375 but found nothing there.

I would be very interested in sharing information withanyone interested in any aspect of MDT monitoring.

Yeah, yeah, yeah, I knew that blurb would get some feedback, but good gawd-a-mighty, Democrats and Republicans are continually proving they are tweedle-dee and tweedle-dum, there ain't enough common sense in either party nowadays to fill a thimble. Gotta try something new, and soon!

Happy scanning there, "etc" guy.

Thanks, Even though a lapel speaker is out, this may help.

You wouldn't believe how loud it gets in the center of a short track
during a race. <G>
It's tough to hear an earphone with earshields over it.

Sure, talking on a cell phone while driving is associated with higher accident rates. It's "distracting", isn't it?

Well, how about having a conversation with the passenger in the next seat over? Isn't that "distracting" as well? What about CBs and mobile ham rigs? For that matter, what about listening to the news on the car radio? Aren't these all distracting the driver from paying full and complete attention to the road?

I wonder who's behind this study, and who'll benefit from it.

You might look into a marine antenna. I just replaced the stock ducky on
my handheld with a marine antenna and it seemed to improve the reception
on the railroad frequencies. I think those antennas are cut to receive
157mhz. Perhaps an outdoor antenna in this range would be an
improvement. Also, RS has a cheap VHF-HI antenna for under $20. Might be
worth a try.

It was cheap, too--only $11. I had to go to a commercial radio store.
I'm not sure if the same would hold true

Those frequencies are both TSL Transmitter to Studio Links. They are
telemetry freq.s used to return the transmitters remote control data
path that is sent to the transmitter usaually over STL's Studio
Transmiter Link. Many times there back up's with phone lines being the
main connection. 450.975 and 455.975 are the other TSL freqs.

<SNIP>
The way I look at it, If I modify a scanner for my personal useage, with no other purpose than to listen (IE: not for illegal activities), especially in the bands above 400MHz, I should be able to do so if I want... Frequencies in the 900 MHz + range have adverse affects on living tissue... If my body has to be subjected to these 24 hours a day, I also have the right to listen to them. If the FCC wants to revoke my right, then I will file suit against them for allowing others to bombard me with those wavelengths and do who knows what kind of damage to my flesh.
Just because they are a branch of the Government doesn't make them right.

Just my opinion.
Dave

A couple of days ago I posted a Question Ref. advice on purchasing an antenna designed for picking out a weak signal in the Vhf HI band (in particular 160-161mhz.) and got a very informative reply Thanks!! But now I think I may have an idea, if someone who has the Know how could please help. I own a Radio Shack all band ground plane antenna. (it's the one with 3 different length verticle elements) Could I remove the two short elements & trim the longest one to make a 5/8 wave groundplane? If this is possible what length would the verticle element need to be, and should I trim the horizontal elements and to what length? Thanks, Willie Brown

Now that's a question a lot of us have been asking for a
while! ;-)

The Icom engineers love to design communication receivers
but not scanners. Too bad for us...too bad for them.

No. Gingrich isn't the culprit. The Martins in Lake City, Fla., who listened to the call in ignorance of the current law, then taped it with the tape recorder they happened to have in thier car connected to the scanner, and who then turned it over to a rep in thier political party, are to blame.

Hi,

I live in the US, and here the FM band is 87.75-107.9 MHz. I know that in other parts of the world it is diffrent. I know this because I have come across several radios that have 76-108 MHz. Where is this band used? I know that the US standart isn't used in Russia because my dad told me that he couldn't here anything on a US radio in Russia except the audio of one TV channel. I have also seen a radio cover 64-108 MHz. I anyone has any information on the FM band assignents in other contries, please post them here so we could all share the information.

Thanks,
Eugene

George,
If you bought the software, and the RS232 interface you can unlock the
cellular freq yourself. Otherwise you have to send it in to someone like
Grover Catalog, where they will do it for a fee.

Don't mean to scare you, but your/our govt can do that without you posting to this or any other group. I am waiting to hear of some poor guy that monitors the secret service & other feds to be arrested for violating national security. If Ruby Ridge can happen, then I think they are capable of just about anything.

From: Don Melano <dmelano@hughes.net>
Message-ID: <33068794.2583@hughes.net>
Source record: 207420

I've had an old Bearcat 210 scanner forever and I wish to buy a new handheld unit, but I'm not familiar with any of the new features and options.

I would like to keep the price around under $200 if at all possible. I am particular interested in military aircraft frequencies as well as the usual police and fire etc...

Any suggestions on particular units I should look at or specific features I should look for or stay away from?

Thanks in advance.

I've found that Bearcat crystals (for 10.8 MHz IF) are as easy
to order through your local Radio Shack as those with 10.7 MHz IF.

Each Radio Shack store has a book on display which lists all the
crystal frequencies stocked by Tandy parts. You can special order
crystals for other frequencies but they take longer.

> ... the frequencies between 174 and 214mhz.
> ... in my freq. list, it states that these are accupied by wireless mikes.

That 'freq. list' oversimplified things. 174-216 MHz is assigned in the
U.S. to TV channels 7-13. When unused in a given area, broadcast and theatre
people may use those frequencies for the cordless mikes used by performers.
Reception range is on the order of a few hundred yards to a 1/2 mile.
It is unlikely that police undercover operations would use a frequency
that could show up on a slightly mis-tuned TV set.

I wonder what their position is on a scanner that can be made cellular capable by holding down a few keys when you turn it on? This is clearly *NOT* manufacturing or even a modification but merely a innovative use of the scanner as manufactured and sold. Hell, you could even do it by accident!

> me email address. Thanks!!!

The schematics provided work fine.

The interface is a simple "Hamcomm" type, zero-crossing detector.

Almost any op-amp will work (except some "hi-speed" op-amps). The
usual LM741, TL081, LF411, etc, etc work fine.

The resistor values are really not that critical. The 100K
resistor from pin 2 to ground provides a return path for bias
current and establishes the input impedance of the interface. The
capacitor blocks any DC voltage.

If you use a JFET or CMOS type op-amp, like a LF411, TL082 or
LMCxxxx, then you can use a 1Meg or higher resistor for less
loading of the radio circuits. (Note: If you use LMCxxxx CMOS
op-amps, the max supplies are +/- 7.5V, not +/- 12V).

I have experimented with adding some positive feedback for
hysteresis, but it does not seem to make any significant
difference.

As long as you have enough signal to "saturate" the interface
(50mVp-p or so), it works fine.

Note that the signal is meant to be taken from a *detector*
output tap, not the earphone jack. If you use the earphone jack,
you can copy some 512 baud pages, but the 1200 and 2400 ones will
be a mess.

Well, I don't know if this qualifies as a "modification", but you
may wish to replace the flimsy factory BNC connector with a new
one. Preferably with a good quality one from AMP, Amphenol,
Pomona or Kings.

Both my HX-1200 & HX-1500 suffered from flimsy connectors. This
could also apply to any similar Regency/Azden portable radio
(incl the HX-1000 and the "Polaris" marine radio).

Luckily, it is a standard chassis mount, solder-lug female BNC
bulkhead connector (UG-1094 type), widely available at any
electronics store (RS# 278-105).

The factory one uses a two-pronged, tuning-fork-like, center
conductor. After repeated use, this contact spreads apart,
causing intermittent connections.

Also, connectors did not "seat" securely onto the factory
connector, so they tended to "wobble", contributing to the
problem. The new connector connects tightly and securely with no
"wobble".

After a while, you get tired of bending the prongs back into
position. And soon you will, as happened in my case, bend them
one too many times. <snap!>

While you are in there, snug up the PCB mounting screws and
standoffs (not too much, or you'll crack the board!).

As for "mod's", I have not seen any. But that does not mean they
don't exist. If you hear of one, let me know!

On 11 Feb 1997 22:50:50 GMT,
in the newsgroup rec.radio.scanner,
award@cisco.com (Andrew Ward)
from Cisco Systems, Inc., San Jose, CA thoughtfully posted:

> Does anyone have knowledge (I'm sure you do!) on whether the mobile
> extenders are continually producing a carrier that can be detected,

"Continuously"...No.

> or only when the officer keys up?

Yes.

> Or is just whenever he (/she) is
> keying is receiving a dispatch?

Yes.

> Does it work when in OR out of the
> patrol vehicle?

Out of...

The car extender repeats everything on both the base and mobile
channels. The officers portable also transmits back on the same
channel. So basically, there is a signal any time there is
traffic on the main channel.

> Obviously, I'm trying to figure out if the Bearcat BCT-7 & BCT-12
> are effective only when there is comm traffic.

Yes. It only works if there are comms. The CHP cars do not
"radiate" anything continuously.

Generally, the officers do not turn the extenders on UNTIL they
are ready to leave their vehicle (they also turn them on when
they get something to eat - it's great if you live near a
Dennys!). The extender signals are generally good for about a
mile.

So by the time you receive the signal, they have already pulled
someone over and have left the vehicle. When they get back in the
vehicle, they turn them off, even if they are still sitting by
the side of the road.

I have been stuck in traffic many times, and have observed them
turning on the extender (it "beeps" when first turned on) and

then getting out of the car. I also watched as they got back in the car, and turned off the extender, even though they remained where they were.

So if you are thinking they are sitting there by the side of the road, ready to pounce on you, "broadcasting" their presence, forget it. They do not do that.

The "Beartrakker" radios *will* tell you that one is around *somewhere*, but that's about it. Don't count on it as an "early warning" device. The radio can also be "fooled".

From your Sisco address, and 408 area code, I "guess" you are in the same area as me. We have a "unique" situation in that units up on 280 can be heard "down here" for up to 10 miles!! (Yes! the extenders!) So your "alarm" would be going off even though the officer may be miles away, way up on a hill, on another freeway! The "hill" signal could be stronger than the unit 1/2 mile ahead of you.

Save your money and get a radio that you really want, and program in 154.905MHz and monitor it.

The info obtained from the extender channel will beat any "traffic reports" that you can get on the radio. :^)

February 13, 1997

MANUFACTURING ILLEGAL SCANNERS
INCLUDES SCANNER MODIFICATION
It has come to our attention that entities are offering to modify scanning receivers (scanners) in order to receive frequencies allocated to the Domestic Public Cellular Radio Telecommunications Service. Such modifications are not permitted under federal law and the Commission's rules. Scanners are radio receivers that can automatically switch between four or more frequencies anywhere in the frequency range of 30-960 MHz. On April 19,1993, the Commission adopted a Report and Order in ET Docket 93-1 amending Parts 2 and 15 of the FCC Rules to prohibit the manufacture and importation of scanners capable of receiving, or readily being altered to receive, frequencies allocated to the Cellular Radio Service. The Commission adopted these rules to implement Section 302(d) of the Communications Act of 1934, as amended (47 USC 302 (d)). Scanning receivers are required by Section 15.101(a) of the FCC Rules to be certificated by the Commission. Section 15.121 states that scanning receivers,and frequency converters designed or marketed for use with scanning receivers, must be incapable of operating(tuning), or readily being altered by the user to operate, within the frequency bands allocated to the Domestic Public Cellular Radio Telecommunications Service. Scanners that are capable of "readily being altered by the user" include, but are not limited to: those for which the ability to receive cellular telephone frequencies can be added by clipping

the leads of, or installing, a simple component, such as a diode, resistor and/or jumper wire;replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device. Scanners and frequency converters for use with scanners, must also be incapable of converting digital cellular frequencies to analog voice audio. Under Section 15.37(f), the manufacture or importation of scanning receivers, and frequency converters used with scanning receivers, that do not comply with Section 15.121 shall cease on or before April 26, 1994.
Manufacturing a scanner to receive cellular telephone frequencies is a violation of Section 302(d) of the Communications Act (47 USC. Section 302(d)) and Sections 15.37(f) and 15.121 of the Rules (47 CFR 15.37(f) and 15.121). The modification of scanners on a substantial scale to receive cellular frequencies will be considered to constitute manufacture of such equipment in violation of FCC Rules. Entities engaged in such activity are cautioned to cease advertising and/or performing any such activity immediately.
The Commission will vigorously take enforcement action against parties found to violate these rules. Willful or repeated violations may be subject to a monetary forfeiture of not more than $10,000 for each violation or each day of a continuing violation, except that the amount assessed for any continuing violation shall not exceed a total of $75,000. See 47 CFR 1.80(a).

>>>> Further, pursuant to 47 U.S.C Section 510, such devices may be seized and forfeited to the United States.<<<<

Use of scanners by individuals to intercept and divulge or use beneficially wireless telephone conversations is subject to Section 705 of the Act. Other Federal and State statutes also apply in this area. For more information regarding the interception and divulgence of radio communications, see FCC FACT SHEET,"Interception and Divulgence of Radio Communications," dated January 1997, which can be obtained by calling the Public Service Division at 202-418-0200 or accessing it on the Commission Internet web site at http://www.fcc.gov/Consumer_Info.html/.

Source record: 207454

Mr. Higdon,

I'm sorry to disagree, but I don't believe your interpretation of the law is correct, and if the court case you cite occurred in circuit court then it established no precedent for any court but itself.

While the unintentional interception of a cellular conversation is not an infraction, i.e. the reception of images while scanning frequencies in the 360 to 385 mHz range on the Uniden 3000XLT and 9000XLT, deliberately intercepting even random cell calls is illegal. If you were to watch a tape of the recent (Feb. 5) congressional subcommittee hearing on this issue you would see that this issue was brought up several times in the context that enforcement of the law is difficult because scanner owners rarely know who they are listening to, and cell phone users rarely discover they've been monitored so they rarely file a complaint. It is made very clear during the hearing that the deliberate interception of even random cellular communications is illegal. (I'm not defending the law, only offering an interpretation of it based on comments made during the hearing.)

John

Interesting definition of a scanner.

So my TV is a scanner too??? (54-805MHz, 6MHz steps, 125 ch).

What about my car radio?? (88-108MHz, 200KHz steps, 100 ch)

What about my old TV with channels 70-83?? It has more than 4
channels *and* is capable of receiving "cellular" frequencies.

Okay....What if you program and scan only three channels???

Below is a snippet from THE ARRL LETTER, Vol. 16, No. 7, just released, regarding Little LEOs trying to swipe yet MORE of the amateur bands. Thought you all might be interested in hearing the latest.

Todd

---------- Forwarded message ----------
Date: Fri, 14 Feb 1997 16:27:00 -0500
Subject: The ARRL Letter, Vol 16, No 7, February 14, 1997

COMMENTS NEEDED BY MARCH 4! ARRL OPPOSES LITTLE LEO EFFORT TO INCLUDE 219 TO 225 MHZ

Commercial satellite interests seeking access to bands below 1 GHz--including amateur allocations at 146 and 430 MHz--now have added 220 MHz to their "wish list." For the first time, Little LEO (low-earth orbiting satellite) interests have proposed including 219-225 MHz in their list of desired allocations for the non-voice, non-geostationary (NVNG) mobile-satellite service (MSS). The move was contained in the industry's so-called "flexible allocation proposal," delivered at the February 13, 1997, meeting of FCC Informal Working Group (IWG) 2A. Little LEO targets now include 146 to 148, 219 to 225 and 430 to 450 MHz. The ARRL and AMSAT were among those objecting to the concept, and the League is urging those who agree with their position to comment to the FCC by March 4. IWG-2A has been preparing draft proposals for the 1997 World Radiocommunication Conference (WRC-97). These will be reviewed during a March 5 meeting of the FCC's WRC-97 Industry Advisory Committee that is preparing draft proposals for consideration by the United States as it gets ready for WRC-97

The ARRL and AMSAT statement said the latest proposal affecting amateur allocations in the 219 to 225 MHz segment came "at the last possible moment" and "without any technical support whatsoever." The League and AMSAT pointed out that the little LEO proponents have had more than a year to complete a technical study of the possibilities of sharing with the amateur services in the 144 to 148 MHz and 420 to 450 MHz bands. "They have not demonstrated compatibility for sharing these amateur bands but over the evolution of their document have proposed various 'new ideas' for use of these bands."

The little LEO flexible allocation strategy for WRC-97--submitted as IWG-2A/86 (Rev. 6)--is to propose broad allocations. The apparent theory is that most administrations would find reasons to oppose little LEO use of specific bands in the crowded spectrum below 1 GHz, but that a broad allocation would permit different implementations in different countries depending on local circumstances.

At the February 13 meeting, a coalition of spectrum interests--including land mobile, amateur, broadcasting, and military--opposed the flexible allocation concept on three grounds: that the concept is simply an invention to avoid performing technical sharing studies that would demonstrate the unfeasibility of sharing; that it is inconsistent with decades of ITU allocations practices; and that, if adopted, the concept would be counter to US interests. The coalition document is identified as IWG-2A/107.

The ARRL and AMSAT submitted a further statement of opposition, citing the absence of any technical studies that might support sharing with the amateur service or the amateur-satellite service and pointing out that the little LEOs have completely mischaracterized the nature of ITU Resolution 640 regarding the use of certain amateur bands in the event of natural disasters. The ARRL/AMSAT paper, revised to reflect opposition to the late proposal to include 219-225 MHz, is identified as IWG-2A/108 (Rev. 1).

Amateurs also might find interesting the comments of the Department of Defense, identified as IWG-2A/101 (Rev. 1). These address the 430 to 450 MHz segment the Little LEOs seek to share.

Anyone wishing to register support for the ARRL/AMSAT submission should send a brief e-mail message to wrc97@fcc.gov. The Subject line should say "Reference No. ISP-96-005 IWG-2A." A simple statement to this effect, "I support the ARRL/AMSAT opposition to the NVNG MSS flexible allocation proposal," will be included in the public record and will help to drive home the point that there is broad-based opposition to poorly conceived sharing proposals.

Please note! The proposals the League opposes are not FCC proposals, nor are they endorsed by any other branch of the government. They are industry proposals. The League's objective is to demonstrate there is broad citizen opposition to the industry proposals, so the government will not adopt them as US proposals. So, please don't "flame" the FCC if you comment.

Additional arguments or evidence also is welcome. Important! Comments should reach the FCC no later than March 4, 1997!

The complete ARRL/AMSAT opposition statement and other comments will be posted by February 15 on the ARRLWeb page, http://www.arrl.org/ under Band Threat News.

FCC ON SCANNING RECEIVERS: POST-SALE CELLULAR MODS ARE ILLEGAL

In the wake of the Newt Gingrich cellular telephone taping incident, the FCC has made it clear that it's illegal for manufacturers or dealers to modify scanning receivers to enable reception on cellular telephone frequencies. A Public Notice, DA 97-334, issued February 13, declares that scanner modification is included in the ban on manufacturing cellular-ready scanners.

The notice comes as members of Congress raised concerns over the widely publicized incident where a cellular telephone conversation of House Speaker Newt Gingrich was intercepted and taped and its contents ended up on the pages of the New York Times. A House subcommittee hearing on cellular telephone privacy that also stemmed from the Gingrich cellular taping and disclosure also addressed the issue earlier this month.

Among those testifying before the Subcommittee on Telecommunications, Trade and Consumer Protection was Bob Grove of Grove Enterprises (and Monitoring Times), who tried to argue that a legal loophole allowed him to sell and then retrofit scanners to pick up cellular conversations. Other testimony focused on the low priority that Congress has placed on prosecution of cellular eavesdropping cases.--FCC/Steve Mansfield, N1MZA

FCC FINES RETAILER IN ILLEGAL SCANNERS CASE

The FCC has upheld a stiff fine against Ace Communications of Fishers, Indiana, for illegally selling scanners that were not FCC-certified and that could receive cellular telephone frequencies. The FCC's Compliance and Information Bureau issued the $20,000 Notice of Forfeiture February 5, 1997, for "willful and repeated violation of Section 302(b) of the Communications Act of 1934, as amended, and repeated violation of Section 302(b) of the Act and Section 2.803 of the Commission's rules. Specifically, the FCC cited the company for "advertising and selling two different scanners without first obtaining an equipment authorization." The FCC complaint involved the Yupiteru MVT-7100 and the Trident TR-2400 scanners. The Commission said it would not have issued an equipment authorization because the scanners in question "were capable of tuning into frequencies assigned to the cellular

telephone service."

Ace had advertised one of the scanners in Amateur Radio publications in 1993, but none of the ads ever ran in QST. The FCC also rejected all arguments to reduce the fine or dismiss the Notice of Apparent Liability.--FCC

Joe,

Are you *reading* the messages posted in this group? or just
missingcertain lines? Is your local server removing some lines from
messages on you without your knowledge?

JT was referring to modifications of SCANNERS to recieve CELLULAR PHONE
TRANSMISSIONS. Where'd you get so general an idea above, there?

well sir, it would seem that they are within their legal boundaries to seize ILLEGAL scanners... a modified scanner violates federal law... tell me sir, would you object to the seizure of drugs, they're illegal too!

In response to Paul's post, here in Southern District, most officers leave their extenders on all the time... It's actually a regulation just in case they forget to turn 'em on when they exit the vehicle...

So where's the part about general seizure of scanners? All I see,
basically, is mention of seizure of devices illegally modified. Mine's not,
so I'm not worried.

The most commond frequency pair for the older McDonalds was 35.02 /
154.6.

It's most likely an image of the 35.02 frequency (35.02 * 3 = 106.06)

Hello Robert,

I have done a wee bit of work on this subject. I "paste" down a
previous posting that I did a while ago - it will save me a swag of
typing!

The circuit at the bottom is best if you are taking the data direct
from a discriminator point. (View the drawing with a fixed pitch
font!)

======pasted earlier conversation==========
d-cripps@dircon.co.uk (David Cripps) wrote:

>Help!

>I've just downloaded the PocSag decoder PD2.03 and am having
>some problems with it.

Hello David

There's nowt wrong with the pd203. The problem will more than likely
extend from one of two things

1) poor quality audio being fed into the interface (Distorted)
2) the audio level incorrect.

Both these can be inter-related.

I have done a mod for the "standard circuit" that is on the net that
has improved matters no end. The inteface is a schmidt trigger that
tries to restore the square wave shape to the audio. It in effect, is
a signal conditioner.

One quick instant tip is: When setting the audio level, start with
virtually nil audio. Increase very, very SLOWLY until the spinner JUST
starts to spin. The best chances of decode is with minimum audio that
will get the spinner going. If you increase too much, you will cause
two things to happen. (A) overload the schmidt trigger and bring up

the additional distortions in the wave form near the zero crossover point - this will introduce false mark/spaces. (B) Introduce harmonic distortion from the audio amplifier from the radio - this will have a similar effect to (A) and compound the situation.

WHATEVER - the audio setting is hyper-critical!

>Also I've read that PD works better when the decoder is connected
>directly to the FM discriminator outout. Does anybody know where
>this is on an original AR3000 and if it does make any significant
>difference?

It will make the world of difference. If at all possible, always take the data audio direct from the discriminator output. (The audio amplifiers in the radio filter or tailor the audio for sinewave not square wave.) The rise and fall time in the radio audio amp is just not fast enough to keep the squareness!

As a precaution I suggest dc isolation should be used - solder a 0.1 capacitor to the discriminator output and take the audio feed from that.

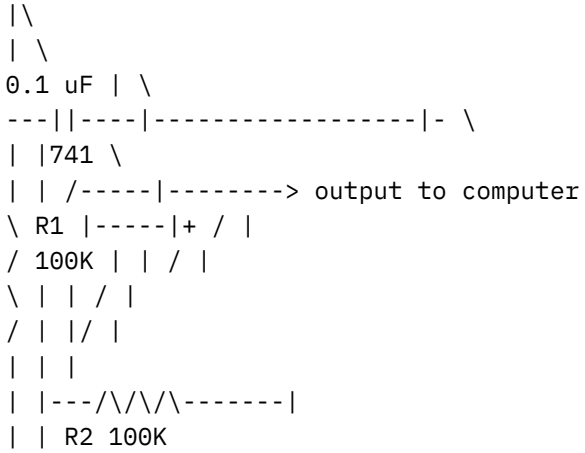
The published schmidt trigger circuit is FAR too insensitive (deaf), even if taking the audio from the earpiece/extension socket. In my lab, I noticed it needed 3 - 4 volts p-p audio to get it triggering!

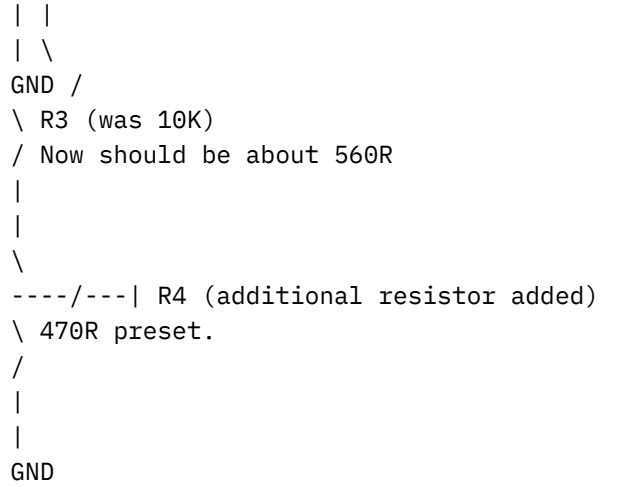
For a earpiece/speaker extension the trigger level (threshold) I would tend to use would be approx 1v p-p audio - this puts less strain on the audio amp and is probably giving cleaner, less distorted audio

For a discriminator output, it essential to provide some form of audio level adjustment - my mod does that. It also increases the trigger sensitivity to about 0.5 to 1 v p-p

View the circuit in a fixed pitch font:-

Basically, remove R3 which is a 10k resistor and substitute it with two resisters in series. One being a fixed value about 560 ohms and the other being a preset/variable of 470 ohms.





Adjust R4 for best decode. Better than 90% can be expected if taken from a discriminator point! (by using 2 resisters here, the swing is less critical, but still possinly knife edgeish!)

The most common frequency for the older McDonalds is 35.02 / 154.6

It's most likely an image the 35.02 frequency (35.02 * 3 = 105.06)

Is this Traxar on a private trunked system owned by the customer ?
Or is it a former Motorola SMR, which was sold to Nextel ? In any
case the old old software used for that unit 'TRSS' is no longer
supported by Motorola TCMS. It's incumbent on the system operator
to provide the necessary files to get you up and running. Nextel is
pretty fucked up right now, just ask any MSS - including the former
COSC's (which are now MSS's).

In fact the entire service strategy of Motorola is pretty fucked up right
now. They have lost customers left and right because of bean counters in
Schaumburg making asinine decisions and blowing sunshine up the
stockholders ass'es. (with regard to LMPS).

You can probably get it programmed, but the hard part will be finding
a service center that has a working Lotus Notes platform and
R-1801 interface.

The most common frequency for the older McDonalds is 35.02 / 154.6

It's most likely an image of the 35.02 frequency (35.02 * 3 = 105.06)

2032. USA Band plan and Cellular info required please

Newsgroup: rec.radio.scanner
Date: 1997-02-15 00:00:00 UTC
From: D.Gray@AutoComm.cityscape.co.uk
Message-ID: <855962908.17957.7@cisas91.demon.co.uk>
Source record: 207564

Hello all

I am researching the US Band Plan and the US cellular frequencies. I
am wondering if any one can answer the following questions please?

==========

1) Are the US Cellular frequencies common throughout the USA?

2) Are Canadian Cellular frequencies the same as the USA?

3) What are the parameters of the US Cellular band?
IE: start freq to end freq, channel spacing (step) and I
presume FM narrow mode?

4) In the USA, what generic service or services are allocated to the
frequencies between 520Mhz and 900 Mhz?
If you can be specific (exact) with start and finish
frequencies, I would be most obliged.

Any help and assistance will be welcome. Thank you.

Donald Gray

Hello all,

They're finally approved by the FCC and released for domestic sale,
and we've got them boxed and ready to ship to you.

ICOM R10 Handheld receiver. Price $489 + UPS

Comes with nicads and wall charger.

Unblocked or cellular blocked same price. Unblocked to government or
legitimate users only.

We can take your check over the phone and ship immediately.

216 units sold, 51 left as of Friday evening. Get yours now, once this
lot is gone you may have to wait.

Call 0900 - 1700 EST weekdays only.

Steve

I could not dgree more, The US congress and a lot of southern states
are very consumer unfreindly. Less consumer protection and caps on
lawsuits filed by injured persons. Another bullshit example is in
Tennessee where a law went into effect jan 1st allowing any cornpone
cop to seize your vehicle if your license is revoked and you've ever
had a dwi even if your not drunk or have had an accident. 30,000 $
cars have been seized sold and the county gets the money, YOU must
still pay the bank loan!!!. Tis bulloney was said to be for public
safety, while in the same session another bill passed aloowing any
moron to carry a loaded handgun concealed anywhere. all you have to do
is give the state 400.00 and not have a felony in 5 years. Now a state
senator who was in a drunken stupor ran over a man on a motor cycle
from ohio killed him left the scene only admitted what he'd done when
troopers arrived at hi door the next a.m. The courts dismissed the
charges. This happend about 3 days before the election and he still
won by a paer thin margin. Makes you wonder about those peoples gene
pool. They live in a dry county and are holy rolers but relect a
drunk that voted to seize their cars if they do not have a valid
license. Scanners are also a topic in the Tenn legislature and I
cannot imagine the braniac law that will come of that!. Give new
meaning to the term "TIB" =Tennessee incest baby

2038. Cell mods illegal

Newsgroup: rec.radio.scanner
Date: 1997-02-15 00:00:00 UTC
From: jtward11@aol.com
Message-ID: <19970215020001.VAA15710@ladder01.news.aol.com>
Source record: 207570

FYI only.

The FCC issued a public notice yesterday (02-13-97) stating that it their position that modifying a scanner to receive cellular frequencies is illegal under the current 1992 amendment to the ECPA of 1986. During a telephone conversation today, Julius Knapp, chief of the FCC's Equipment Authorization Division, told me the FCC considers modifying a type of manufacturing, and of course, manufacturing cellular capable scanners has been illegal since April, 1994. He also said the FCC will take enforcement action against anyone advertising such modification services, or who is found to be modifying large numbers of scanners. Enforcement against Grove Enterprises has already been initiated.

Frankly, I disagree with the FCC's interpretation of the law. I do not believe there is a clear prohibition against modifying scanners in the existing statutes, but the final interpretation will likely be made in a court of law.

It's not the food orders that most people want to listen to. The
employees have a switch on their headsets that allow them to
communicate with each other internally. You would be suprised
at what you can hear!

If you get a chance, you should check out the August and November
issues of Monitoring Times. They contain articles on Fast Food
monitoring.

The article in the August issue of MT can be viewed online at:

>the 902-928 and 939 MHz ranges which many scanners now cover and
>which are becoming more active.

That's a pretty big catch. Even the expensive models have a problem with images, though. When I bought my BC9000, I was looking forward to being able to monitor military aircraft. Unfortunately, images from about 500 MHz away manage to show up in the military air band. This makes searching almost impossible, as the 800 MHz band (and I mean the whole band, not just cellphone freqs) is very busy in my area. I imagine that one filter could have prevented this situation, but, that would have cost money. I suppose that by allowing these images to occur, they can increase sales to people who want to monitor cellphones.

As you said, the manufacturers will probably just cut out image prone frequency ranges, rather than putting in the filters necessary to avoid images in the first place. I wonder if I could somehow design my own switchable filter that would prevent frequencies above about 400 MHz from entering the scanner when I was monitoring the military air band...

What a DUMBASS!
Its not illegal to OWN a scanner that picks up cell phones. Mine is a
pre 1994 ban Pro-43. Its illegal to listen to cell phones.

When they turned the tape over to their rep, it included a written request
for amnesty for making the recording and the intercept. And they just
happen to stumble on the right frequency at the right time while engaging
in a casual scan of the band. Yeah, right.

Huh? What kind of dope have you been smoking? You think Newt called the Martins and said "would you please monitor and record my cellphone call, then release it to the NY Times?"

Why don't you thank Mr. and Mrs. Martin and their willing accomplices in the Democratic party...Thurman, Mc Dermott, and Bonior, for the newfound regulatory hassles that our hobby will soon face as a result of their actions?

Did anyone out there use their scanner at the Daytona 500 race ?(Feb 16/97)
If so, did the frequencies correspond to the old 96 frequencies?
What stratagies did you use? (ie-Gordon on one bank and Earnhardt on another?)
Were any frequencies blocked?
The reason why I ask is because I am going to Sonoma,Ca. May 4th to check out that race.

Look carefully at Table 2: E receives 144-146 and 430-440, while E3
receives 67-180 and 400-512 MHz.

It appears there is no way to get the 800 MHz band on "K" (U.S./Canada)
models, which should make Newt Gingrich happy.

Page 16 appears to be missing from the JPG images.

I use one on my AR-8000 when I want to listen to VHF lowband and even down into HF, it does a fair job, certainly much better than the stock rubber ducky attenuator. You can adjust the length of the antenna to suit the frequency you wish to listen to.

For 10 bucks, it's not a bad deal.

Happy scanning,

Jon

>

I suspect the front-end tuner does not have enough range for this. I
suspect
it has three discreet front ends, like most double conversion scanners.
One for 100-200Mhz,
one for 400-500+, and one for 800-999MHz. These could physically tune a
little beyond their
ranges but if pushed too far: 1) the PLL will not lock on the local
oscillators, and 2) sensitivity
will be reduced by a high degree. Performance is peaked for the two ham
bands. So the
200-300 MHz cutout is due to neither 2M or .75M front ends can reliably
lock onto this. Some
units might get some of this if the logic circuytry is overridden.

As far as the ADMS family software, it may be possible to alter the data
file with a hex
editor to add these frequencies. They may be floating point binary numbers
so you need to know
the IEEE 754, etc. Take a file of known freqs to find the pattern.

Not exactly, you are not allowed to discuss business over Amateur Radio.
Also, you have to know a thing or two about electronics to participate.
The CTIA
would only lose a small amount of business with this.

And a Cable TV converter/tuner for the 30-550MHz bands. And make a small
rcvr to convert
an IF of 45 -70MHz to audio using a Motorola 3363 or similar IC. ANd of
course a PLL to control it and
either program a PC or use a PIC or 8051 CPU to do this. Alot of work but
can be done.
Contact a firm called Science Workshop in Bethpage, NY they sell a
spectrum analyzer kit for
about $200 that has all but the PLL and controller. Hooks to a scope to
determine spectrum use but
could monitor.

2071. PRO-2005 for sale, make offer

There's lots of information published in "Nuts & Volts" about this
sort of thing, although I haven't seen much in the last year or so.
If you can find some older issues, you could learn a lot. They also
have a website that may have some of that information, or links to it.
Haven't checked out the site recently myself.

2078. "registered scanners"

Newsgroup: rec.radio.scanner
Date: 1997-02-16 00:00:00 UTC
From: mjh@online.bc.ca
Message-ID: <33079495.10214492@news.online.bc.ca>
Source record: 207112

Heard on local Police freq.(140.370mHz) female police radio dispatcher relaying message to cruiser from a "registered scanner operator" via a landline re. a prospective drug deal going down and the purcaser was intoxicated (double whammy for RCMP). The dimwitted dispatcher was willing to give the officer the registered scanner operators phone number over the radio!! (should additional details be required)One can only surmise the repercussions should his land line number get into the wrong hands, (maybe the last diode he ever severed).
My question then is how many North American Police departments utilize the sevices of so called "registered scanners" who relay confidential info.over cell/cordless phones to authorities. And are the police legally entitled to act upon the info.relayed via private QSO's on cell/cordless???

2079. Re: Help Identify UHF Data Signals

Source record: 207113

Thanks everyone for the quick responses. I started getting E-mails
just a couple hours after my post.

It has been nearly everyone's consensus that what I am hearing is a TV
transmitter to studio link, most likely telemetry data from the
transmitter.

> If you have one of those old RTTY-reading programs and an interface to
>your computer, try hooking up your scanner to the computer.

Actually, I did find an old 300 baud modem (in an ancient Tandy 102
computer). I set this to dial in "reverse" mode, and connected the
receiver audio to a phone plug and into the modem. The computer
accepted each of the two signals as a valid carrier and proceeded to
print out garbage characters. This is presumably binary data.
Unfortunately, that modem is only capable of 7-bit operation. I tried
it with a newer PC modem but couldn't get it to recognize the carrier
- it's apparently looking to do some handshaking first. No great
loss, of course. If it's just telemetry data it will probably not be
possible to interpret without knowing record formats, etc., and not
very interesting once decoded.

>
> See? A stop by the FCC web sites does pay off. :)
>
I didn't realize that the FCC had this type of database available on
the web. I'll search for it and check it out.

No...no...no

Dat ain't the answah brah....

The FCC is an anacrhonism in the ointment. We are thinking "like
the enemy" if on our side.

The better answer would be: a free Society where all ideas are
discussed in an open forum of exchange mandates the FCC be
eliminated. They don't serve any purpose now if all that they
can do is "sieze" products that "listen in" on what is said by
those who use radios.

Answer: Eliminate the FCC. Make it a consumer protection like
agency that advises on answers gotten by 1=900 used.

Make people pay money to talk to FCC.

Think.

bill conduit
etc.

a free society does not need the federal govt telling it what to
listen to or not to listen to no matter the source. I don't hear
Pat Robertson or his criminal-cohorts who practice "eye-squeezing"
communication to go get a FCC license ... to talk to some imaginary
cloud=like figment of our conditioned consciousnessness.

Complicity. Dupes. Just happened to be listening.

Get a JOB.

People...this is straight out of Mission Possible. the CIA at their best now...this is what all those agents do now that they have nothing do do in protecting the USA from internal strife and education.

People...the martins are the source. they are part of the solution devised by the agencies so named to put the issue up there with "someone killed Bambi".....

Live your life with a mind that functions: it's a soap operatta brought to you by the elected body of people who NEED AN EXCUSE to deny you what to this date you have been getting and for some reason the US government has prospered.

IT's just now that more people have scanners and more people are listening to what our officials are doing, yet still comprise a small minority...the rest of the population get their news form the controlled press....too scared to report the truth becaues they may incite some bureaucrat inside the FCC to be threatened and then threaten to hold up FCC renewal.

All this because the Cellular Industry is in charge of what Congress shall or shall not do to the people who elected them.

Remember: the Phone Industry just got allowed to compete on the world markets...if they can get away with it here and show the third world dictators how they did it, then it won't be long til the Phone Companies will be in charge: they will hear everything all over the world.

That is more insidious than the message in Fahrenheit 451 or even
Brave New World.

Hey, don't knock it until you've tried it!

The employees have their own private channel that they can
use to talk to each other in between orders. The big
thing for me, is to listen for the off color remarks that the
staff at the drive thru make. The real fun comes when you
freak out one of the clerks by commenting on something they
say about the previous customer. They starting worrying that
they might have said something that went out over the intercom
to the customer. This has a very chilling effect on the clerks!

I also enjoy tracking down new Fast Food frequencies, because
they're not generally listed in any Scanner guides.

Alas, most radio-room calls are taped (as I'm sure most of you know),
and something of this nature wins no awards in the supervisor's eyes. ;)
My SO is a dispatcher, and I've suggested this quite a few times
(although I also know her boss, and she probably COULD get away with it
on a few 'special-idiot' calls ;).

Having said that, I've called her a few times during the summer to let
her know when some heavy weather stuff is going on. NOAA seems to lag
gettig info broadcast to their station, so I let her know when a
tornado/thunderstorm warning comes through. But that's a tirade for
another day (crappy local weather-spotter network, moving NOAA offices
50+ miles west.. *sigh*).

Hi,
Just got my first scanner which is a Radio Shack Pro-25 Portable
scanner.

Can anybody who know offer some tips. Can it be modified ? Is it a
good scanner ? Should I take it back and spend some extra cash for
a better one ?

Any info is greatly appreciated.

Thanks,

Darrell

I didn't go to Daytona, but I've scanned plenty of races. Best way to organize is to assign car # to each channel when programming, then lock out the one's you're only secondarily interested in. For instance, Channel 2 would be Rusty, Channel 3 is Dale, etc. Or it could be channel 102 is Rusty, 104 Sterling, and so forth -- depends on how many channels your scanner has.

Does anyone know if the Rat Shack CENTER-LOADED
TELESCOPING
WHIP ANTENNA, #20-006 is any good or is it just
as crappy as
the standard rubber ducky?

Thanks

2107. Re: What is the law on cell and cordless phone listening

Hey man....how about pulling that board out of your ass.....its only a
hobby. You don't have to get uptight about they guys comment. A lot of
newbies are ignorant to the laws.

The most common frequency pairs to check are:

30.8400 --- 154.5700
31.0000 --- 170.3050
33.1600 --- 154.5100
33.4000 --- 154.5400
35.0200 --- 154.6000
154.5700 --- 170.2450
154.6000 --- 171.1050
457.5375 --- 468.3875
457.5500 --- 467.7750
457.6000 --- 467.8250
461.0375 --- 466.0375
460.8875 --- 465.8875
461.0875 --- 466.0875
469.0125 --- 464.0125

If they're using "3M" or "GM" headsets then you need to search
from 920-922 Mhz Wide FM for the speaker frequency and from
903-905 Mhz Wide FM for the headset frequency.

An ariticle on Fast Food monitoring appeared in the August 96
issue of Monitoring Times. It can be view online at the
following URL http://www.grove.net/fastfreq.txt

This list covers most Fast Food chains across the entire US.

How about the Standard C508A dual band ham unit which is an excellent scanner and very small. Has 60 memories in banks of ten and covers everything of interest including 800 mhz area (cell blocked) except 30 to 50 mhz. Reception using "image" frequencies easily defeats the cell blocking.Do not need to modify.Has various types of searches and scans. Very weak tranmitter. Runs on two AA batteries for what seems to be forever .
Supplied antenna (rubber duck) not especially good but works great with Comet SMA 3 antenna. Available at local ham store .

Guess if we can't enjoy our hobby, why should the hams enjoy thiers,
right? Let's drag em down too; and invent a conspiracy theory to boot.

The hams bands aren't _next_; our bands were _first_. THEN the Lake City,
Fla. Martins came along and started the hoop-la going on _you_ guys.

We've been in the process of defending our own highly popular 2-meter and
70-cm bands from takeover by "Little LEO" companies who seem to think that
research isn't necessary to determine whether or not our bands are
compatible with "sharing" with thier services. Failing to gain much ground
in that, now they're going after what's left of our 220-MHz band as well
(started that just the other day as a matter of fact). This would have the
equivalent effect of going to radio broadcasters and saying, "our research
indicates that we can share your broadcast bands with out low-earth orbit
satellite services" -- where they hadn't actually done any "research" at
all, and simply make the request to the FCC. They make these proposals and
then leave it up to the attacked service to do the research for them -- to
prove it ISN'T compatible for sharing, forcing THEM to hire the lawyers and
spend all the money.

At this moment, the ARRL pretty much has it's hands full, and isn't about
to come to the rescue of a hobby not directly related to amateur radio.
It's monetary resources are already tied up in lawyers and researchers for
the little ongoing fiasco right now.

You're better off organizing your own group effort and asking for
membership fees and donations just like the ARRL does, and fight for your
hobby the same way. A scanner is not a licensed two-way transceiver. You
do not need an FCC license to own and operate one. Therefore, scanning is

not something the ARRL would considder defendable.

Personally, if it came down to keeping my scanning hobby or keeping my 2-meter band, scanning will lose because it serves less of a useful purpose comparatively in my life. A scanner won't let me make a free call home to tell my wife I'm going to be late because the traffic's a little heavier this evening, or get me out of being stranded if I'm in an accident like my 2-meter mobile and backup HT will do. Incidently, there's no beating a free phone patch when you put THAT up against a cell phone. What rates do they charge them to use that phone? and how much did they pay as well for the cell phone itself? A pretty high price for a device with just one use and one use only. AND, I can adjust the output power to anything I want to complete the communication, I'm not limited by "cell-range," and our repeaters usually have a much wider area of coverage. I pay $20 a year for my mobile phone patch privileges. Sure, I have to limit them to personal only -- not business communications. But I have no use or need for a phone that allows me business comms. Beat that price! :)
Personally, put one up against the other, and I think that warrants saving far more than scanning does; and I'm a scannist.

For me, scanning is a "convenience" that I use to help me if I respond to an emergency call being a member of my local ARES group. But, it isn't necessary. If necessary, I could probably still get the written permission or a license, if required to do so, to keep it -- because of what I do in public service, too. But the county provides pagers and equipment necessary that would make the scanners not all that necessary, really.

...This is, of course, an opinion, and, just being the devil's advocate.

>confirmed this ? Thanks

I haven't confirmed it yet but reportedly USCG Group New York uses
171.3375 to relay Ch 16.

The USCG has another remote wide-area relay for Ch 16 on Cadillac Mtn
(Bar Harbor, Maine) on 16?.??? that routinely picks up traffic from as
far away as Boston.

A few years ago when I traveled the east coast alot I used to monitor
another Ch 16 relay that was atop the Delaware Memorial Bridge.

The CoGuard uses these relays as a means of monitoring Ch 16 distress
calls over a wide area.

Sound card software is probably not far away, but it's still going to require a discriminator connection in your scanner.

IMHO I don't think that generalized software could reverse all of the distortion that all of the different scanners can create with their audio amplifiers.

Cheers

In his defense...

Except that the newbies themselves are coming across as "people who know"
when they makes those grand, sweeping, absolutely false and rediculous --
and unresearched -- statements. Then they back it up with more opinion,
rather then go to thier local library and quote a law cite to back them up.
Truth be known, there are none available to back up most of the opinion
being stated as fact that I've been seeing in here.
Then more newbies come in and read that crud and take it as real expert
advice. Next thing you know, somebody takes this illiterate advice and
goes out and openly brags of monitoring cell bands to people and next thing
you know that person is sitting in jail, citing "yah, well, those guys on
rec.radio.scanner said it was okay!" First, people should know better;
but still...

Most of the drivel I'm seeing in here so far seems to be coming from
far-right, redneck, anti-communist gun-packers with no education, wearing
combat fatigues and hoping for a war, and who think that no research is
necessary -- except "what I think is what really should BE the law, it
makes sense so it MUST be the law, and so that's all that you should worry
about, my friend." I'm sure they'll appreciate you for that when they're
sitting in a jail cell because of what stupidity was said in here, and
thought to be real fact, when it actually isn't.

Sorry. But I hate seeing misinformation being spread especially when it
has a chance of being taken seriously and actually causing real people real
harm.

Some of the very same people who are being criticized in these threads
actually RUN scanner-related LAW pages, and those sites should be visited
first before anyone considers taking anything by mouth seriously in here.

Dave Stark, for example, runs a site that contains -- guess what? -- text of some of the actual federal laws regarding scanning! He's also a law major and an educated person and has spent a lot of his free time to BRING that information to you at no cost. I think he deserves compliments rather than harassment as some have been doing in here.

When you want to view the actual text of STATE laws regulating scanners and radar-detectors while mobile, and what states have those laws -- you can visit MY site, too. It's free and all it takes is a second to type in the URLs to educate yourself and be able to say "yes, that's right" or "no, that's wrong...BECAUSE..." and know for sure. It's out there. People just need to use it.

I picked up an old scanner at a garage sale, a
"Tennelec memoryscan-MS 2".

It appears to be require some sort of binary
programming to set the channel frequencies,
but I'm guessing as I don't have a manual.

Can someone email me with programming
instructions and/or *any* information about
this strange radio ?

Thank-you !

And there, my friend, is the EXACT reason why the ARRL should defend any other hobby that is threatened by CTIA. Free phone patches are COMPETITION for the cellphone companies' god-given right to make piles of money, which they can then use to keep the politicians who are good to them in office.

>of being modified then it can seize those radios as evidence of a crime.

Not exactly. The FCC can only seize radio equipment that is used to transmit illegally or cause unlawful interference to licensed radio services, or equipment that violates their technical regulations (not type accepted, etc.).

>They can also seize a scanner if they have reason to believe it is being
>used in the commission of a crime, i.e. monitoring cordless and cellular
>telephone conversations. Simple ownership of a cellular capable scanner is
>not a violation of law, nor is a modified scanner illegal.

That is outside the FCC's jurisdiction. Such seizure would have to be made by the FBI with a properly executed search warrant (unless you were standing on a street corner listening to mobile phones).

>BTW, I suppose a person who sends their scanner to someone to be modified
>could be guilty of solicitation.

This is a possibility.

While what bill says, (below,) may sound a little loopy for most tastes, (mine included), he is correct in that the government beruecrats [sic] are only in the business to keep themselves in business. Bill's basic premise is closer to the truth than many would like to believe. Their jobs are no longer a means to an end, but rather, have become ends unto themselves. They will do ANYTHING to keep these jobs. Both elected and appointed. Term limits? fat chance. Without pointing fingers at any individual such as Pat Robertson, we should all be aware that we have almost lost the battle. We should look to the Federal, State, County, and local beurocrats. (dammmm! I never COULD spell that) Watch them. Ask them pointed questions in public. Don't give up. And, , ,Just because I'm paranoid doesn't mean that they are NOT out to get me. (and you!)

Well, from my personal experience I can only say that when I tried
buying from them lately, they weren't very enthusiastic to answer my
technical questions, let alone ship to Isreal (would you believe they
said they WOULDN'T ship to Israel?). Here's a clip from one email I
got when I insisted in buying from them (would you believe it?...:-):

>
>WHY NOT BUY THE ITEM FROM SOMEONE ELSE.
>

Treating me like a nusiance...This really pissed me off, resulting in
the following email to them...:-)

>To sum it up: I am a bit dissapointed by your sales attitude, as
>opposed to the attitude I got from other companies in the business
>(JDR, HRO, and several others), all much more cooperative and NONE
>claiming delivery to Israel was impossible. Please provide me with
>your name and Scanner World's marketting manager's email address or
>fax because I want to discuss this issue with someone that might want
>to solve this simple problem. I hope I DO get an appropriate answer to
>this request promptly.

Needless to say, this guy chickened off and never responded (even to
reminder emails). I would call this bad pre-sales (wonder what would
have happened if I ordered the product - might have ended just like
you...:-).

Yep, I was pissed off by this attitude. I can warmly recommend JDR,
HRO and GROVE, at least in terms of responsiveness
I ended buying from Grove, although their sales department had a
similar attitude. On the other hand, their tech support guy (channel)
seems like a really nice fellow and provided very thorough (and
pleasant) answers.

That's my two cents...

good luck.

Their lack of funding seems to be our only source of hope. I really don't see them spending all kinds of cash on enforcement unless the ATF gets bored and wants to kick some ham shack doors in to help their butt buddies at the FCC. (or blow them up) If our government had skads of money to burn then I might be worried. However, I am still extremely pissed that the assholes in DC can bend over so far to reach their toes just for some money from the Cellular industry or the little Leos. Let me tell you this. If the little leos take over any of the ham bands, they're going to have to put up with a shitload of QRM (man made interference) from my location. I'm going to be giving them as many watts as my wallet will allow.

George: I just read an article in Electronics Now that said the NE602 was only good up to 200 Mhz or so. I also thought of doing this until I read that article. I would think a homebrew receiver published in a magazine of some sort would be kinda cool. Hey, it's not illegal to publish information is it? Any shmuck with a soldering iron and a Digi-Key catalog could put one of these together!!! I've been playing around with a couple of older cellular phones I bought at a hamfest strictly for this purpose. If only those bastards would give us some data on those big square chips in the phones, we could just gut a cellphone and hack it a little. It shouldn't be all THAT difficult. IF (big IF) we could get our hands on pin outs of the chips in a phone. Anybody have any???

NFM DISCRIMINATOR CHIPS - BASEBAND AUDIO - SQUELCH GATE DATA
==========

There is a growing interest in tapping the baseband audio out of
various scanners for decoding of a variety of esoteric signals,
including CTCSS, SCA, FSK, RTTY, FAX, etc. By and large, such signals
cannot be take from TAPE REC jacks, headphone jacks, and EXT SPEAKER
jacks because of the voice-band filtering that is done between the
signal source and these output jacks.

Therefore, it is necessary to tap the "baseband audio" directly at the
output of the discriminator chip for your scanner. The below Table
shows a list of scanners, the discriminator chip(s) used in the
scanner, circuit symbols of those chips, and three pins of general
interest on the chips: RF-Input, Scan Control, and, of course, the
baseband audio pin.

Even though your scanner may not be listed, if you can find its
discriminator chip, it will be listed with one or more scanners below,
the pins of which will be the same for your unlisted scanner!
Corrections and additions to this list are requested. See my mail and
other addresses at the end of this file.

Here's one undesireable scenario:

In order to save money, scanner manufacturers could continue
to build inexpensive models which employ 10.7 MHz range IFs
but exclude frequency coverage above 869 MHz. That would omit out
the 902-928 and 939 MHz ranges which many scanners now cover and
which are becoming more active.

:>OK.......you've piqued my curiosity! Does anyone know the frequencies
:>for McDonalds or other fast food drive thru's used in the OCALA,FLORIDA
:>market...... I've got to see for myself what the fascination is.....

If you find out, about the fascination that is, please let me know. When a local drive thru came in on a frequency allegedly allocated for narcotics enforcement activities, I thought it was interesting... for about 10 seconds. I quickly lost interest in whether the current customer wanted extra cheese on their breakfast burrito.

I can understand wanting to be aware of the frequencies so you know what's happening when you start hearing someone ordering a burger, but beyond that it's a mystery to me.

Phew! You don't need a soldering iron to do the mod on the Pro-2004...
just a pair of snippers and a phillips... but you better do it now,
before the snippers are outlawed too. (Toenail clippers will work too)

Hmm... maybe the law that says that once all scanners manufactured
after a certain date cannot be readilly modifiable, all scanners already
in existence also conform by osmosis.

It's right there, in black and white "Capitol Hill Digest BS-1997-1"

If you burn them too soon, you can obtain a copy (Pro-2004) if needed
at http://www.io.com/~tweek/2004/index.html

>well, the
>scanner is still legal to own. Of course, you still can't USE those new
>frequencies . . . . . .

I disagree. You CAN, IMNSHO, listen to those frequencies, as long as
the signal you are listening to is not in the Cellular Communications
Service. If you are the sort of person who believes that there may be
other life forms in space, and that they are trying to communicate with
us, wouldn't it be wise not to ignore the 50 mhz of frequencies which
fall in that range? (Don't laugh... ever heard of SETI? If our
is wacky enough to fund projects to transmit to aliens, there just might
be some alien government just as crazy.)

>Is this ridiculous, or not. (BTW, I still stand by my position that
>cordless and cellular monitoring is ethically wrong and should be illegal,
>but that doesn't stop me from appreciating how ridiculous these laws - and
>their interpretations - have become.)

Let's see if they try to stop me from publishing my How-To page. That will
be the day ALL will know our government has gone overboard.

I think I'll complain to my congress critter about my WWW page.

Alan, I am not too sure about the Beep... but you may find this usefull!

MODIFICATIONS FOR THE PRO-37

The disassembly instructions are based on the excellent PRO-34
instructions

provided by Chris Scholefield (chriss@mid.com). I have added my own

comments.

First of all, what modifications are possible?

The PRO-37 uses a diode array to tell its microprocessor what model it

is, and thus which frequency bands to allow and what channel spacing to

use. European and Australian models have full 800 MHz coverage (at an

unknown channel spacing) and a VHF-Mid band (68-88 MHz) rather than a

VHF-Low band (30-54 MHz).

The Canadian and US models differ in the amount of care taken to reduce

EMI. The Canadian model has additional screening, and one or two other

minor component additions to achieve this. Therefore, if you have the
choice,

the Canadian model is preferable to the US model.

Changing from VHF-Low to VHF-Mid band coverage requires many

component value changes (and realignment of the appropriate RF stage).

Given that the PRO-37 uses SMT technology, it's not worth trying.

(You can change the diode array easily enough, but just don't
expect reasonable performance!)
The only sensible (straightforward) modification is the restoration of
full 800 MHz coverage on Canadian and US models. The ranges restored
appear with a 30kHz channel spacing - which just happens to coincide
with the N. American cellular telephone channel spacing. A remarkable
coincidence.
The modification described is therefore applicable ONLY to Canadian and
US models. (European and Australian readers could always remove
800 MHz coverage if they wished:-).
You will need:
Soldering iron - with a fine point. (The components desoldered
and soldered are not SMT, but ....)
Desoldering tool - to remove excess solder
Philips screwdriver - if it fits the screws on the back of the
case it's the right size.
Small pliers - bending component leads while unsoldering
and removing hexagonal posts
Earthing wrist strap - strongly advisable with CMOS components.
(Static can cause premature, if not immediate
failure of components). Wear this at all
times.
Small screwdriver - for prying components etc.
Experience and confidence in working with modern electronics
A couple of hours without interruptions...
Instructions
---
0. READ THROUGH ALL OF THESE INSTRUCTIONS BEFORE STARTING!
1. Remove the battery
2. Remove the antenna
3. Pull to remove squelch and volume knobs

4. Unscrew the 4 screw on the back of the case

5. Separate the case beginning at the battery end and work over the circuit

board and knobs at the top

6. Unsolder both connections to the antenna - ground can be bent away and the

centre has a link to the board

7. Unsolder the two power switch links at the board end

8. Unsolder the ground connections to the metal shield

9. Disconnect the two connectors to the squelch and volume controls

10.Remove 4 hexagonal posts

11.The top board may now be removed by separating it gently from the

connector on the adjacent board

12.Remove 3 screws holding the shield in place

13.Lift the shield to separate it from the lower control circuit board

14.Identify diodes D12,D13 on the control board

15.EITHER cut the diode D13 and SKIP to reassembly OR continue to desolder diode

16.Remove last two screws and remove control board. Take care not to

dislocate the KEY LOCK switch when doing this.

17.Unsolder screening from side of control board near diode array,

and bend back out of way.

18.Unsolder and remove diode D13. Keep it somewhere so that you can replace

it if required to do so by US legislation.

Reassembly is the reverse of the above procedure.

If you performed steps 16-18 CHECK REALLY CAREFULLY that the metal part of

the KEY LOCK switch is in the right location. (Otherwise, you may find

yourself having to disassemble the whole thing again - I know, I did!)

NOTES.

1. One must exercise great caution in the procedure. Check that no flakes

of solder get dropped on the boards. Take anti-static

precautions by doing the work on a mat and wearing a wrist strap. Do

not make any adjustments to the upper analogue board or bend any of the

other wire links on it, which are tuned circuits.

2. Another caution is that doing any of the work will probably violate

any warranty you may have on the scanner. Might be worth burning the

scanner in for ~150 hrs before attempting this to reduce the risk of

a latent component fault appearing after you have made the modification.

3. YOU PERFORM THE ABOVE PROCEDURE ENTIRELY AT YOUR OWN RISK. You may

wish to obtain a copy of the PRO-37 Service Manual from Radio Shack

before attempting this. (Cost about $20 - well written - just wish

I could afford all the service gear required!)

4. If you happen to find out what adding D14 does (another difference

between N. American and European/Australian versions), I'd be

interested to know. It's not mentioned in the service manual. I think

it could affect 800 MHz channel spacing - any info on the European

Australian PRO-37 specs in this area would be appreciated.

5. If you found something wrong in the above instructions, let me know

and I will try and post an update.

6. If you found all this helpful, help someone else and donate $5.00

today to your favourite charity.

Share and Enjoy!

PRO-37

This works. I have used this procedure to modify my pro37. One note: there is no reason the remove the logic board. If you have skinny wire cutters, you can easily get to the correct diode. This will save you the trouble of getting the key pad and key lock back together properly.

Restoring the full 800Mhz coverage of the RS Pro-37 scanner.

The following notes have been shamelessly plagiarized from Mark Miller's excellent instructions on modifying the Pro-34. The two scanners are physically so similar that I needed to make only a few minor changes in Mark's notes to make them fit the Pro-37.

The instructions below are for those that don't like to completely dissassemble every new electronic toy they buy just to see how it works. Nor is it for the guy that has been building their own equipment since the days of the first tube diode. This set of instructions assumes a moderate level of skill with a soldering iron, and some simple hand tools. It is aimed at those who just want the additional coverage from the mods but havn't been building kits for a decade.

lets just call these ....

"NOVICE NOTES" FOR PRO-37 MODIFICATIONS

1. Remove the 4 small phillips screws on the back of the unit

2. Remove the battery cover and battery holder from the case. You won't

loose your programming as long as you don't take all day to do this.

3. Remove the two knobs on the top of the case (Volume & Squelch)

4. The case snaps together at the bottom via two molded "hooks"

in the back half of the case which fit into two indentations

in the front half. These can be snapped apart by applying

the right leverage to bend the hooks away from the indentations

that they fit into while pulling the case apart. You'll see what

I mean when you look at it. You need to be a bit careful in

forcing the two halves of the case shell apart. Once you have

the snaps at the bottom released, angle up the bottom of the case

until the battery separation wall is clear of the internal metal

frame, and slide towards the top of the unit. Place the back half

of the shell aside.

5. Now you will see the RF board mounted to the metal support frame. The

BNC (antenna) conector leads and the volume control power switch leads

are soldered directly to the board. Carefully desolder these 4 connections.

7. There will be a wire from the volume control knob to the PC board that

is plugged in. Remove the plug from the RF board (needle nose pliers work)

8. There will also be a similar wire (small shielded) from the squelch control

to the RF board wich is also plugged in. Remove the plug from the RF board.

(Again Needle Nose Pliers work good here)

9. Remove the 4 threaded hex stand-offs from the RF Board (these hold the RF

board to the internal metal frame AND are where the screws that hold the

back of the case screw in) Use a nut driver or Needle Nose Pliers.

10. Now the RF board is mostly free. The only thing holding it in is

the row of connector pins on its botom side that plug into the logic

board. You will need to pry this board up gently. Be warned that

the bottom side of the RF board is just chock full of Very Small

surface mounted components. So use something non-metalic and smooth

to do the prying with.

11. Set the RF board aside.

12. The Internal Metal support frame is now exposed. there are 3 small phillips

screws holding the metal frame to the bottom Logic board (actually, these

screws go through the logic board and into the front half of the case)

2 of the screws are near the top, and 1 is at the bottom of the metal frame.

Remove these 3 screws.

13. There is a small socketed wire that leads from the small power pc board

on the metal frame that goes under it and is plugged into the Logic

board. Lift the metal frame up and remove the power plug from the

PC board. Place the metal frame with the rest of your parts pile.

14. You have the component side of the Logic board exposed now. There are

2 small phillips screws at the bottom of the PC board (where the Battery

compartment WAS) Remove them.

15. Once you have the the last 2 screws removed the Logic board is free. The

speaker wires lead from the speaker to the logic board on the bottom side.

These are soldered in but there is enough play in them to allow you to

make the mods.

16. NOTE: The keyboard lock switch is a funky little piece of plastic with

a sliding stainless metal contactor that is just wedged in between the

front case and the logic board. Remove both the switch contacts and the

plastic switch. (best know it now or loose them in the carpet)

ALSO: don't touch the innards of the keyboard itself, which will now be

exposed. It appears that the keys make direct contact with pads on the

circuit board, and you don't want grit and skin oil to be getting in there.

17. On the component side of the PC board you will see lots of nifty surface

mounted components, a box-like capacitor (used for maintaining the

channel freqs while you change the batteries.. and make modifications :)

near the edge of the PC board you will see a couple of small diodes mounted

vertically. These will be labeled on the PC board as D12 and D13. You will

also see places for two other diodes to be soldered in (labeled D11 and

D14) but nothing is installed in these.

18. Now carefully clip the lead coming from D13 and bend the

diode away slightly to make a gap between the resulting two pieces

of wire. Clip it near the middle to leave plenty of room to resolder,

in case you ever want to undo the mod.

You have completed the mod for complete 800mhz band coverage.

Follow the same steps backwards (18->1)and replace "remove" with "replace"

and "desolder" with "solder"

N.B. These instructions are from last night, All the steps are in correct order

as well as the general information. The diagrams are from memory so components

may not be in the exact location indicated, but they will be very close.

LASTLY, Now that you have made the mods, you can use the warranty card to

light the Bar-B-Q Grill with.

Follow the mod info for the PR0-34 except remove diode D13 on the cpu
board.

This is the lower of the two diodes (D12, D13). Don't waste time prying
any

shields off as some mod info may say to do, just remove the 3 screws
holding

the frame to the cpu board, swing the frame out of the way.

Change capacitor C-170 on the linear board from 0.047 uf to 0.10 uf for
better

audio quality. This cap is near the big 16 pin detector chip IC-101 and is a

(relatively!) large mylar unit on the component side of the board. Upping its

value raises the low end audio a little, enough so it won't hurt your ears if

you have sinus problems. Hi.

Hmm. Kinda reminds me of the RFI argument. A few pennies per TV would solve a lot of ham vs. next-door-neighbor RFI arguments. But, they're out to make a buck. So, it's easier to leave out the protective shielding and leave the hams and neighbors to argue amongst themselves. Who cares if the judge doesn't understand TVI and the real causes and the ham ends up getting the raw end of the stick in a judgement.

Hi. I was wondering if anyone has a mod for discriminator output on the Icom 2SRA HT? A schematic of the radio would probably be the answer..

Any help would be appreciated..

Thanks..

Joe

If you have one of those old RTTY-reading programs and an interface to
your computer, try hooking up your scanner to the computer.

450 MHz is right where the 70cm ham band ends. The band beginning at
450.050 to 450.925 is allocated by the FCC to "Broadcast Pickup"; as is
455.050 to 455.925.

See? A stop by the FCC web sites does pay off. :)

I was wondering if there is a program out there that would allow you to decode tramsmissions from a MDT using a regular scanner w/ earphone jack and a sound card on a computer? I don't have a computer interface capable scanner, so all of those options are out. Just curious, I know you can decode pager transmissions and other stuff.

Here is the extended 800 MHz mod for the PRO 2036/BCT890xlt. Could anyone PLEASE help me in interpreting how and exactly where to put the damn resistors??? Any help is appreciated

BC890XLT-800MHZ FULL RESTORE

1. REMOVE ALL CABINET SCREWS.
2. REMOVE 4 FACE PLATE SCREWS AND 1 BRACKET SCREW AT CENTER OF MAIN BOARD.
3. CAREFULLY DEPRESS THE OUTSIDE EDGES OF FACEPLATE SHIELD AND TILT DOWN.
4. UNPLUG J4 AND J5 AND RIBBON CONNECTORS J501 J502 AND J503.
5. REMOVE FACEPLATE AND LOGIC BOARD.
6. POSITION BOARD SO MICROPROSSOE CHIP IS ON LEFT AND MEMORY BATTERY ON RIGHT.
7. LOCATE THE 3 CHIP RESISTORS AT CHIPS UPPER RIGHT..MARKED 104 AND CAREFULLY DESOLDER.
8. INSTALL THE CHIP RESISTOR AT THE 2 EMPTY PADS CLOSEST TO MEMORY BATTERY.
9. REASSEMBLE CAREFULLY IN REVERSE ORDER.
10. TEST BY ENTERING FREQ. AROUND 870 MHZ.

> Seems plain eunff for me.

Actually, the label usually reads "Privacy of communications MAY not be insured when using this phone." (Emphasis added.) And at that, they don't paint or otherwise highlight these warnings. Rather, they make it a raised-letter part of the black, plastic bottom of the base...usually. Barely noticeable. Definitely not something obvious.

..."MAY" not be guaranteed??? What's with them? Kinda like cigarette manufacturer's warning labels they STILL put on boxes of cigarettes: "...smoking MAY be hazardous to your health."
But I'll tell yuh "what's with them..."

They really don't want to come right out and say, flat out: "Use of this phone is in no way a guaranteed means of secure and private communications. Extreme caution should be used in whatever you say while using this device." But this might not get them the sales they want. So, they hire the psychologist and the lawyer (so-to-speak) and what you currently have on the back is what those combined minds suggested be used in order to ensure the highest profit while also not technically being false -- and possibly liable later -- in thier statement.

> lock it out....

The interference is no worse than any other 15x.xxx service (ever
driven by Moffet??? - Gawd knows what they are working on there!
- my radio goes NUTS!)

For 6 years I commuted up & down 101, from San Mateo to
Sunnyvale, and I always listened to the extender channel.

By listening to the extender channel, you did not have to switch
channels as you go between "offices", *and*, if you listen
closely enough, you can develop a sense of how far ahead they are
and the number of patrol cars.

How? The extender interrupts it's signal every half second or so
to "listen" and see if there is "another" extender on channel. If
it detects another transmission, it stops transmitting.

If there are a few cars near each other, with all their extenders
running, you will hear a "squeal" for the first part of a
transmission - as all the extenders key up at once.

Then, as each extender "shut's-up" and listens, and detects the
other extenders, it quits transmitting. Then the next extender
"shut's-up" and listens, then quits. The extender with the
"longest" "listen" period is then left transmitting.

So by listening to the number of "dropouts", you can surmise the
number of cruisers at an accident scene before you get to it!

Ah, the games we play when we are stuck in traffic....;^)

> In response to Paul's post, here in Southern District, most officers leave
> their extenders on all the time... It's actually a regulation just in case
> they forget to turn 'em on when they exit the vehicle...

It must depend on the particular offices. Our officers seem to
turn them on just before they get out of the car. I cannot recall
ever hearing an (extender) signal from a moving car, or a car
just sitting on the side of the road by themselves.

I have watched many times as the officer pulled over, turned on
the extender (beep!), got out of the car, checked on the
motorist, got back in the car and turned it off.

(yes, traffic can be *that* bad here too!).

I've often wondered if the radios are coupled to the "park"
position, or if we just have very vigilant, well trained
officers!

I wholeheartedly agree.

The Dispatchers are the "unsung" heros of many situations.

The "Boys in Blue" and "Fire Eaters" do a helluva' job, but
someone has to sit behind the scenes and orchestrate the whole
mess.

If anything, kudos to the folks that have to deal with the
"general public" at such an initial emotional level. Folks don't
call 911 just to say "hi". Those first few minutes on the phone
can be the most critical minutes, the difference between life and
death. A calm head at this time can save the responding units a
lot of grief.

I spent a year as a "REACT" monitor (before there were car
phones), and I got a very small "taste" of what they go through.
It is not fun, and it really can "get" to you at times.

From the idiots who call with the most innane, stupid,
ridiculous, "what-the-hell-were-you-thinking"
complaints/requests/demands, to the "thousandth" disabled vehicle
report, to the person gasping for their last breath of air with a
screwdriver stuck through their chest, the range of calls is
amazing.

I do not know how they deal with it. It takes a certain type of
personality. I can't even imagine what a dispatcher/calltaker for
New York or LA must go through!

I can't think of a time I ever heard a dispatcher "loose it". I
have heard officers and sergeants loose their cool, but not the
dispatcher. They may get "testy", but they still keep their head.
They have to be just as "professional" as the officers.

Go ahead and vent, Bill! You won't find a more sympathetic set of ears than this group! We appreciate what you and your counterparts do.

Hey, you may even be a "radio star" amongst a few dozen folks in your community!

Keep up the good work! And please feel comforted that your efforts *are* appreciated.

> My local news just carried a report stating that the use of cellphones
> in vehicles has shown to be as likely to result in accidents as the
> use of alcohol.

I saw that report, too. It must have been a slow news day.

It goes deeper than that. People seem to forget that they are
DRIVING!!!

The cars no longer have any "road feel", and the distractions are
numerous.

Double soundproofing, silky-smooth suspension, power steering,
computerized climate control, "ergonomic" car seats, cruise
control, fancy sound systems that rival most home systems, car
phones, tinted windows, etc, etc... Just look at the "cockpit" of
most new cars, I doubt if the space shuttle has as many buttons,
knobs, switches and widgets!

They forget they are in a two-ton steel box flying at 65MPH!!!

The last thing they are worrying about is Driving!!!

I live in "Silly-con" valley, home of the "Kar Fone".

"If I had a dime" for every time I had to dodge a "stupid" act by
a person "yakking" away on a car phone, I *could* be a rich man.

Do I think people should *not* be allowed to use a phone while
driving? No. Keep the "gubernment" out of our lives. There are
other ways.

Let the idiot in the Lexus/Accura/BMW/Mercedes plow into me. I'll
own that car and 1/3 of his income if he does!

If you are proven to have been using a car phone during an
accident, or any traffic offence, you should be considered to
have been "impaired", and suffer the financial/legal
consequences.

The threat of higher insurance rates is a greater deterrent than
making something "illegal".

Some people hold their liquor better than others, some people
hold their cell phones better than others.

From what I have personally seen, the use of a cell phone *does*
slow down some peoples reaction time. It *does* distract their
concentration. They swerve "outside" the lines while dialing.

As silly as it sounds, I would have to somewhat agree with the
findings of the study. I am not sure about how the data was
collected for the study, but I do see a correlation between cell
phones and "impaired" drivers.

Am new to this newsgroup and have read nearly every message. Still am looking for Uniden SC-150 mods, but now with a brain-ache. Would greatly appreciate any/all ideas, rewarded with a full set of Lenten prayers.
Take Care, God Bless.

Hey! Glad you liked it! I'll write you one if you wish!

You'll be happy to know I changed my sig for this group over to
my "sig-lite". Just for you! ;^)

(actually, I had switched it previously, but my newsreader seemed
to "forget" that I changed it, and used the "big" one instead)

I apologize for the extra few miliseconds of download time. :^)

Cheers,

Open up thy eyes and see the lightning

a bolt of redundancy has passed between your mind-stem...
quit being an apologist for the idiots who are now in
power who call themselves "looking out for you" people.

they are 'bought' by the cell industry and they will do what
their masters tell them is right to do so the master don't
have to do anything like "spend money" to fix THEIR problem.

As I said, it's criminal what the cell phone companies
charge for use of the lines...a dollar a minute?

No competition. They don't have to compete.

Making citizens of a free country criminals beause they are
able to "hear" because they don't make the right chip that
would solve the "don't listen to this" problem now before
the Congress.

No need to read between the lines...do you think they really
listened to what Bob Grove said...they are going through
the motions of "being public" ...

There are hidden agendas which the Congress has: one of them
is to disable people from listening to things they may say.
It's a protect our hallowed sound-walls in congress. the
people in charge seem to be the Cell companies.

Notice how Congress seems so hurried to legislate against how
we can think and now against what we can or cannot hear. Is

not this concept the riding philosophy of the Bill of Rights?

Notice how Clinton has gone on record as being against people having too much Rights. Look what he signed in the Computer Decency Fiasco ACT...he signed into law that it is illegal for people to think and talk and act about abortion over the computer networks....

The average citizen upon hearing about this will yawn and go back to sleep. It don't affect them.

That is the obscenity here.

Money controlling our freedoms and how they are configured to suit the profits of those who buy off the givers of that freedom or not.

They ARRL should be very much against the Scanner Law because if Congress takes away our scanners, what's going to be next! THE HAM BANDS! After all, the ham operates have transmitters which could be used to transmit messages to other countries after the US takes all our rights away and the citizens start to fight for their rights!

>slightly different, I think.

There are provably secure methods of encryption. The one time pad is the classic example. It is unbreakable even in theory as long as the cracker can't gain physical possession of the key. This scares the government silly. If such encryption tools became widely available to the public, and some of them are really quite simple, it would be impossible for the government, or anyone else, to snoop through citizens' computer records or eavesdrop on their telephone calls.

You can easily implement a one time pad on your PC equipped with a CDROM drive. If you have a speakerphone on your PC (like those which come on COMPAQ's multimedia machines), you can make provably secure telephone calls to someone with a similar setup today. And you can encrypt your private files so that no one, not even the government with their most powerful computers, can crack them without the key.

The technology is available for provably secure communications and provably secure computer records today. The government doesn't want you to know that, and it doesn't want you to use it if you find out about it. But the genie is out of the bottle. Anyone can do it today if they wish.

I don't think I have ever heard of the 178XLT. Where did you buy it?
How many channels and what freq ranges does it handle? I bet wherever
you bought it renumbered it so they could say they were the exclusive
carrier of that radio. It probably is the same as some other radio out
there with a different number.

2210. Help Identify UHF Data Signals

Newsgroup: rec.radio.scanner
Date: 1997-02-16 00:00:00 UTC
From: fgk@iquest.net
Message-ID: <33065365.489639@news.iquest.net>
Source record: 207284

While using the search mode of my scanner, I ran across two data signals in the UHF band - on 450.025MHz and 455.025MHz. These signals sound like the old 300 baud modems - and I confirmed with a spectrum program that they contain the two frequencies around 1070Hz and 1270Hz. The 450.025 frequency seems to transmit 3-4 "bursts" of several characters every couple seconds, and the 455.025 one seems to be continuously transmitting characters. These transmissions are FM with a good signal strength (I am using only the scanner's build-in antenna), and appear to operate continuously.

I checked my Radio Shack "Beyond Police Call" directory and don't see anything allocated to these frequencies. Does anyone know what these are? I live in central Indiana, about 30 miles NE of Indianapolis.

If anyone is really interested, I could post WAV files of the sounds.

Au contraire. How many hams, especially from the rapidly-growing no-code Tech class, began by listening to the 2m and 70cm repeaters on their scanners before deciding to become licensed hams?

ARRL, are you listening. Do the right thing for a change and put your legislative muscle up against this pending new anti-scanner legislation. If this nonsense passes, where do you think the next generation of hams is going to come from?

The FCC is DEAD WRONG on this one. There is NOTHING in the ECPA that
forbids modifying a scanner, only prohibitions against selling scanners
that have or can easilly be modified.

Hopefully, Bob Grove will have the guts (and the $$$) to raise his middle
finger, point it towards Gettysburg, and fight them on this one.

Considering what some idiots in Washington call an assault weapon, it would not be much of a streach for the same people to call a soldering gun an assault weapon.

Most NY/NJ retailers that advertise better-than-normal pricing usually take your order and, when you call back two weeks later to ask why it hasn't arrived, state that the product you wanted is unavailable, but they "happen" to have a package deal that includes the item and a bunch of over-priced accessories (cases, etc..). The unit alone is not available. Can't say that this is the case with Smile, but beware.

the AOR-8000 has the capability..it's just that this ability has been disabled in some units....

I have two AOR-1000 radios..both receive 0.500-1300mhz with NO GAPS

the 8000 is a step up from the 1000..is remote programming, ability to "clone" a radio..etc

lets write to Newt Gingrich and tell him we thank him for what he's done to our hobby!

I feel that if people want their conversations to be provate then don't use any device (cell or cordless phone or phone patch) that broadcasts whatever they say so anyone with the proper equipment can receive it.

gee if you don't like something..give a few congressmen enough money and what you don't like will be declared illegal or an agency can change a rule to forbid whatever you don't like and allow whatever you like...all it takes is enough MONEY and POWER!!

for the rest of us, let's let our numbers be known..write to
Senator name
Washington DC

Congressmen name
Washington DC

Many now have E-Mail addresses too!!

When will someone design a 900MHz receiver using an NE602 chip? It would be great to see a schematic and/or construction artical appear on the net or one of our great radio magazines.

Could be a simple design using a VCO with a pot to control frequency, after all who really needs to know the exact frequency anyway while listening to cell calles. For the advanced Homebrew'er, it would be nice to control the VCO via a PIC chip, then the PIC would output the frequency via LCD display.

Howabout it, any takers?

George

Yes! Through the magic of the Internet and FTP, I am now proud to offer you...the distinguished readers and participants of rec.radio.amateur.misc...the opportunity to download five newly created and digitally mastered sound files! Hear for yourself why I affectionately refer to 3894-dot-5 as "The Zoo of Amateur Radio." Just listen to what you get:

1) BIG-AL-SAT-NITE-LIVE...Hear Big Al, "cranked up" and ready for a night's entertainment as he encourages and provokes his arch-rival "Pork Butt!"

2) PORK-BUTT...Listen to Pork Butt return the fire! Featuring the famous "white trash in America" monologue.

3) PIG-PEN-PETE..."HO HO, HO HO, HO" Here's our friend Pete, getting in his two cents' worth...and being severely admonished by his fellow amateurs for his efforts.

4) RALPH-THE-THIEF...Check out Big Al's response when he discovers Ralph's attempts to wreak havoc on his reception by transmitting the sounds of a BABY CRYING in Al's neighborhood!

5) THE-JAMMING-STOPS...Pork Butt on the offensive, commenting on Al's latest attacks.

It's amateur radio at it's best! Hear for yourself what I've been talking about on this forum. All original hits by the original stars of 3894.5 that made 'em famous! Digitally mastered for optimum sound quality and available NOW via your modem at the following FTP site: members.aol.com:/mnmaniac/3894.5

Don't delay! Download today! And thanks for yer support! :-)

-Drew in Sunny Central Florida-
CB Radio KADF-6895 since September, 1976
Amateur Radio KF4DDM since September, 1995
Radio Personality since August, 1983
Scanner Freak since portable radios with "Police Band" were high-tech

Bill,

So, how's that groundhog doing?

The same fellow that gave me the other info also told me that they are quite aware of the illegal shipments and will be "taking action" to stop them, but he would not go into details. I suppose they'll ask Customs to crack down, but I don't know if they will try to use the companies' records to track down illegally imported scanners and prosecute the purchasers.

Just guessing, but I'd say they may go after folks who have imported large numbers of cellular capable scanners but ignore single-unit purchasers.

Was there actually a sound clip provided? If so, I'd be interested in
listening to it. I can probably tell him (her) what it is - MDC,
GE-Star, etc, and may also be able tell what's in it.

> GOVERNMENT!!!
>
>
You're talking out of both sides of your mouth ASSMUNCH! On the one hand
you're crying for the government to stop trying to protect you from
everything. On the other hand, you want them to ban handguns and
SO-CALLED assault weapons. You lit the candle and you're just beginning
to get the picture. You might want to consider pulling your head out of
your ass now so that you can see the light of day! They are trying to
usurp our freedoms through carefully coreographed campaigns. e.g.
disarming our society by attaching scary names to guns, manipulating
public opinion, then banning arms in the name of public safety. When was
the last time you saw someone walking down the street with an AR-15?
They say we have to get these guns off our streets, but if you have even
half a brain in your skull, you know they're not on our streets in the
first place! They are, however, the most effective weapons that could be
used to RESIST the government (get the picture?). Now they're trying to
claim the airways, which have always been free and open, in the name of
privacy. At the same time they're passing legislation to make it much
easier to remotely tap your phone, and much more difficult for you to
encrypt your communication (so much for their privacy concerns). This

society had better WAKE UP! I've owned these guns for years. I use them for sport and defense. I've never even considered committing a criminal act. If you think taking them away from me makes you any more safe then you're playing right into their hands and you're nothing more than a fool being led off to slaughter. Maybe it will strike home when they call your receiver an ASSAULT SCANNER, and try to paint you as a pervert for evesdropping on other peoples conversations. "We need to get those high-channel-capacity assault-style-scanners with conspicuously-protruding-antennas off our streets! They could compromise the integrity of law-enforcement-communications. Police officers could be killed! The small handful of people that use them for non-criminal purposes just need to get a new hobby." Keeping the airways open, like keeping society armed, is an important check (as in "check and balance"). It is a measure to help make sure that police and government don't operate in secret and have absolute power. OPEN YOUR EYES WIDE NOW!

"This year will go down in history. For the first time, a civilized nation has full gun registration. The streets will be safer, our police more efficient, and the world will follow our lead into the future."
--ADOLPH HITLER, 1936

"This year will go down in history. For the first time, a civilized nation has full SCANNER registration. Communications will be more private, our police more secure, and the world will follow our lead into the future."

2260. ICOM 7100 Scan Delay Problem...

Newsgroup: rec.radio.scanner
Date: 1997-02-17 00:00:00 UTC
From: Rolf Mathson <rmathiso@ix.netcom.com>
Message-ID: <3308DB36.6BA1@ix.netcom.com>
Source record: 206979

When my ICOM 7100 stops on a frequency, during a scan I am unable to get it to pause after the carrier is dropped. According to the documentation the default should be 2 seconds or if I select DLY it should pause for the time specified in the scan mode setup (5,10 or 15 sec.) Neither one seems to work....the scanning resumes immediatly upon loss of carrier. The "infinite" mode (i.e. stay on the frequency forever once triggered, works fine...). I'm in the Bank Scanning Mode.

Any ideas???

Many thanks,

Rolf

I have never heard of a "registered scanner". I don't know why anyone would want to monitor cell phones & etc. (which just happens to be illegal) and then call the police and tell them what you heard..... That just dosen't make any sense to me, but maybe I don't get the whole idea of the concept.

Why do people always want to give up the ship when the FCC starts barking. If half of these people would get involved in the fight to keep our rights under the constitution we would not have all these problems. We have to stand together or we all lose, ask any ham who has been around a while, just how much of the band they have had taken away already and how much is going to go onto the auction block now that Uncle Sam has decided that it is easy to grab because no one puts up a fight. Anyone who thinks this won't happen is delusional, but some people like to say "as long as it's not me go right ahead and take it". What happens when it is you????

Ok folks....we have done enough bitching on here including myself.
We need to do something about it now. Most of you just want to bitch
about it and do nothing else. Well its time to do something or shut the
hell up!

Go to this site and check out the email addresses and complain to them.
It the FCC
http://www.fcc.gov/how2contact.html
Don't be a asshole about it. Just explain why you feel that they should
not be alowed to take any part of a harmless hobbie away.
There are other places to voice you opinion too.

You might think that this is nothing, but they are slowly taking away
things that use to be legal in everyday life.

If you don't speak up, then do us all a favor and shut the Fuc* up.

Hi folks,
I am prototyping my DDI.
I am using a 4046 to do PLL for data syncronizing.
I have probs in locking...Can somebody suggest me
which phase comparator is better to use (Xor or the second one?)
and the frequency of the external low pass filter?
I've putted the lock frequency range quite narrow....

Using FM-wide demodulation results much better...do some one know the
exact
bandwidth for cellular telemetry?
Thx

It's 172.920 Mhz. I'm in the midst of moving so the neat & tidy
source list is not with me. Therefore, suffer with my sloppy one.

172.290 Black dot
151.055 White dot
151.085 Gold dot
154.570 Blue dot
172.500 Silver dot
172.980 Yellow dot
151.625 Red dot
151.955 Purple dot
154.600 Green dot
172.290 Green dot
172.470 Orange dot
172.590 Grey dot
172.920 Brown dot

If you want the UHF versions, just yell.

> can not only hear your kids yelling but also hear your neighbors!"

Most Fast Food chains use their headsets for internal comms when
a customer places a special order. This accomplished via different
PL tones (CTCSS). You will often hear them make rude comments about
the person placing the order. You can also have alot fun sometimes,
by responding to any internal comms that may take place while you're
still at the drive-up speaker. They'll think they pushed the wrong
button, and will wonder what actually went out of the the speaker!

I remember an incident about a month ago, where I had full car load
of people that could not make up their minds on what they wanted to
order. This really pissed the clerks off and they started talking
about how long it was taking us to order. At the point I responded
to their internal comms. This made them think that their headset
system was screwed up. We listened to the next two order after ours
and found that they were no longer using the internal comm switch to
communicate between the two windows!

Going by the info presented in your post, you're making an assumption
that the "registered scanner operator" (similar to "registered sex
offender?") obtained the information via eavesdropping on a wireless,
'private' conversation.

Down here in the colonies, the sad little CTIA convinced the ignorant
buffoons in Congress to make it illegal to monitor cellular (& later
cordless). If tips based upon cellular/cordless phone communications
are passed on to law enforcement agencies, they should be done
anonymously, and without mentioning that the info was derived via
'wiretapping.'

A person could say the same about many types of monitoring. Who could get excited about planes taking off? How about a railroad switching yard? WOW! talk about dull!! Or a school bus (yawn) I thought The Idea behind the hobby is to listen to communications. I listen to all of the above and many other types because you never know what you are going to find. I work next door to a Mcdonalds and tuning in their drive through window has provided hours of very interesting conversations ranging from the simple comments made about customers to employees having sex in the bathrooms. Maybe you Just don't listen long enough. I think that this newsgroup should be a sounding board for ANY type of scanning question or comment and not just the ones that suit you.

Just a "Brain Dead" person enjoying some exciting fast food monitoring

> phone 20-30 miles away?

The following is a list of frequencies for Fast Food joints
along East and West Patrick Street and Market Street in
Frederick, MD

RESTAURANT CUSTOMER (R) CLERK (I)

Boston Market 33.4000 154.5400

Burger King 33.4000 154.5400

Kenny Rogers Roasters 469.0125 464.0125

Kentucky Fried Chicken 30.8400 154.5700
35.0200 154.6000

McDonalds 35.0200 154.6000
469.1875 464.1875

Popeyes 469.0125 464.0125

Sheetz Gas Station 469.0125 464.0125

Taco Bell 33.1600 154.5150

The answer to your second question is NO. The best that you
can hope for is about 1/4 mile for 46/49 Mhz and 1/2 mile
for 902-928 Mhz phones. However, there are a few cordless
phones in 26 Mhz range (not for sale in the US) that can be
heard from several hundred miles away when the condition are
right. I came across two of these last summer while I was
receiving Skip from Florida and Texas (I'm located in
Germantown, MD). They were on 26.365 Mhz and 26.345 Mhz
operating in FM mode. I've seen these type of phones
advertised in the back of a United Airline magazine once.
They claim to have a range of range of 5 miles and operated
in some where in the 11 meter band. They were for export
use only.

It's not the food orders that most people want to listen to. The
employees have a switch on their headsets that allow them to
communicate with each other internally. You would be suprised
at what you can hear!

If you get a chance, you should check out the August and November
issues of Monitoring Times. They contain articles on Fast Food
monitoring.

The article in the August issue of MT can be viewed online at:

Not under normal conditions. However, on rare occasions signals in this
range can travel over greater distances due to atmospheric anomalies.

Jon,

Yes, you can hear yourself, or friends order... but the big thing for me, is to listen for the off color remarks that the staff at the drive thru make. One evening, while listening to a drive thru waiting to place my order, a friend of mine and I heard the clerks discussing between themselves whether black or white women had better breasts. You name it, you will hear it at the drive thru. The real fun comes when you freak out one of the clerks by commenting on something they say about the previous customer... they start worrying that they might have said something that went out over the intercom to the customer... this has a chilling effect on the clerks. There is also what others have posted, the enjoyment of tracking down the frequencies. I have heard the clerks make comments about the staff at the fast food store as well... so, it is very interesting. Just my $0.02...

The dispatcher who originally posted this has a valid point.
Your suggestion is great. In addition, maybe the public relations officer can help to address the proper use of scanners, and interaction with dispatchers.

2307. Re: freqs for talk/news radio and tv news feeds

Newsgroup: rec.radio.scanner
Date: 1997-02-17 00:00:00 UTC
From: grohe@galaxy.nsc.com
Message-ID: <33090e5f.5469427@139.187.185.38>
Source record: 207026

On 16 Feb 1997 07:27:04 GMT,
in the newsgroup rec.radio.scanner,
theebaker@aol.com (TheeBaker)
from AOL http://www.aol.com thoughtfully posted:

> Does anybody know how i can find the freq's for talk/news radio and tv
> news feeds. I have the 1995 edition of police call and beyond police call
> and i don't know where to find them. I have tried to find them and i am
> not sure if they are in there. Anyone who can tell me would be greatly
> appreciated.

I believe the basic channels are 161.64 to 161.76MHz, 450-451MHz
and 455-456MHz. Radio station studio to transmitter audio links
are in the somewhere in the 950's.

If you are talking about traffic copters and TV remote crews,
search the 450MHz and 455MHz channels.

The best time to scan these frequencies is around 5-6PM, at about
the same time the 5:00 or 6:00 news is on. Traffic chopper
reports start around 4:00.

Note that what you hear from the chopper may be "ahead" in time,
by about 7 seconds, from what you hear on the "air" (because of
the stations "dump button" or "delay").

Radio news reporters seem to just use cellular phones.

Most of the "Juicy" tidbits from the TV news crews are now
relayed by cellular phone (there is always someone from "across
town" listening). Generally, signal checks and cues are done over
the radio channels. You will often hear the TV station audio
being re-broadcast. This is the feed for the reporters earpiece.

Take a peek at this site, it is for the SF Bay Area, but you can
get an idea of what to expect.

http://w5gb.nmsu.edu/kc5kto/localfrqs/california/sfnews.frq

Generally, you hear 2-way comms from the TV news vans, a few
low-power digital telemetry links (transmitter status data), and
the occasional "remote" broadcast.

During commute times, you can often hear the "traffic choppers"
doing their "reports". Generally on the 450MHz band.

The 455MHz band is the "repeater input" channels to the 450MHz
band. If you have trouble hearing the chopper on the 450MHz band,

try listening to 455MHz band (the chopper may be higher up than the repeater!).

Radio Station remotes can use any of those frequencies. I have heard them on all the bands (161,450 & 455)

A few years ago, I was able to monitor the SF Giants radio feed from Candlestick around 161MHz (161.76?). I doubt if they still use it.

So, just scan 450-451 MHz around 5 o'clock. Within a half hour, you will probably have found everything.

OOPS! You selected two newsgroups erroneously.

alt & rec.RADIO.scanners has nothing to do with picture-type
scanners (unless you count Wefax). These groups are for "scanning
radio monitors".

PLEASE REMOVE REC.RADIO.SCANNER AND ALT.RADIO.SCANNER FROM YOUR
GROUPS LIST BEFORE POSTING OR REPLYING!

Thanks!

BTW: You did not mention what operating system and type of
scanner you are using. That *might* be important!

Cheers.

The ICR 10 is rapidly getting the reputation as a virtually useless
scanner...on this group at least.
I have had one for several weeks and agree that there are points where
it may not match the state of the art big $ rigs.
However, it does everything I want and does them well.
There have been complaints regarding scan speed in memory
mode....guilty. I cannot understand why Icom allowed this to happen.
BUT I rarely have more than 20 memories in a bank so ,as far as I am
concerned there is no problem.
It will also scan only one bank at a time....not good for some users.
But there are so many banks that it is no problem to have a bank or
banks with a mix of frequencies copied from their home banks for
random scanning.
What I really like is the ability to carry 20 preprogrammed search
banks with all the bells and whistles and another 10 inthe "easy" mode
with basic functions only.
I have owned about 10 scanners over the years (currently ICR 10, Icr
7100, Welz 1000, Bearcat 760 and Yupiteru 7000) and I am satisfied
that the 10 is excellent value.
If you plan on loading 1000 frequencies and using all of them
often...you may not agree.
Brian

yes...just what you want to hear. Mostly this:

"higher, higher, higher, lower, lower, lower....higher,
45 good...."

"van 4, give me a call...code 3"...

"van 5, your mother called"...

"we have a breaker, call in"....

"set up near the bridge, we need a direct feed to Sutro"

"sutro is down, go to Mount Diablo"

"bob, go outside and turn your cell on"....

"van 3, get gear and meet us in the lobby for a
shoot, we need a vsot"....

"van 9, we have word that the subject was moved to
the hospital, go to it now."

"van 3, you are going to be assessed penalty points"....

"van 4, are you though with eating dinner?"

"van 2, we got a cell call from a viewer driving behind
you that your left tire has a gizmo protruding from it.
could you pull over and check it out"....

"van 7, would you go back and retrieve your reporter?"

bill conduit
etc.

There is a broadcast booklet out. It's a blue faced thing
which lists all tv/radio frq's....

most scanners store/ham stores sell them....

: >after everybody gets them on the market.

: I know. For $199 on sale (or $125 used) you can get their HTX-202.
: Add a week of studying for a Ham ticket and you can be doing 5 watts
: simplex or hit multiple repeaters. Or on the cheap side, for as little
: as $40 you can pick up big CB handhelds that should be close to 4 watts.

There are fualts to this analogy.

1: All people involved in ham radio must be licensed. I seriously doubt
a person will convince his camping buddies all to get licensed just to
talk on the radio.... too much headache.

2: CB... well, parents give a child a radio in case of problems. He/she
calls the parents, and some idiot comes in there with some vulgar
language....

FRS fills the void between CB and ham radio.

I had a bad experience experience with a BEL detector. I bought an entry level model a few years ago. It worked fine for a few months then it started going off constantly as if there was an invisible cop driving behind me with a radar gun on me constantly. BEL replaced it with an identical model which after a few months developed the same problem. BEL replaced that one with an upgraded model which again developed the same problem. Finally, BEL upgraded me to an even better model and it finally worked. It was a lot of hassle spanning many months but the radar detector I now have was worth over $200 at the time and the original one was $99 from Sam's Club.

Heh...of course, for anyone who has ever tried to do anything inside the
R-1 or its same-sized ham rigs, this nearly falls outside the realm of
"easily modifiable". I repair a lot of the 2SATs, and I wouldn't even
have opened the case without the several years of SMD repair experience
I've acquired. Icom seems to have nearly made a loophole in the law by
their teensy-tiny radios :)

Ace Communications got a $20k fine for selling these radios. Evidently
they didn't have the FCC's permission yet to release them. How do you
like the radio?

2323. Record from Scanner??

It is. Check the archives for rec.radio.scanner and you'll see at source code for at least one of the MDT programs.

Can anyone tell me what this sound it. I hear it a lot through the 8
hundred's and some in the 9 hundred freq.
Thanks.

Sin

Try 500.5125 PL=2A for Rahway PD.

As indicated in a previous msg, the FD appears to be using 501.1375 with a PL=2A, however, the same freq and PL is used by Freehold PD in Monmouth County. 453.125 is assigned to Linden with PL=2A and carries EMS communications.

Rahway also may be using 502.8375.

Fast Food frequncies are the same across the entire USA.

The most common frequency pairs to check are:

30.8400 --- 154.5700
31.0000 --- 170.3050
33.1600 --- 154.5100
33.4000 --- 154.5400
35.0200 --- 154.6000
154.5700 --- 170.2450
154.6000 --- 171.1050
457.5375 --- 468.3875
457.5500 --- 467.7750
457.6000 --- 467.8250
461.0375 --- 466.0375
460.8875 --- 465.8875
461.0875 --- 466.0875
469.0125 --- 464.0125

If they're using "3M" or "GM" headsets then you need to search
from 920-922 Mhz Wide FM for the speaker frequency and from
903-905 Mhz Wide FM for the headset frequency.

An ariticle on Fast Food monitoring appeared in the August 96
issue of Monitoring Times. It can be view online at the
following URL http://www.grove.net/fastfreq.txt

This list covers most Fast Food chains across the entire US.

Without listening to the clip provided, I will take a wild guess and say
that you're hearing digital data channels used by a computer-controlled
multi-channel trunked radio systems. If possible, pick up a copy of
Police
Call available from most Radio Shack stores and scanner dealers to learn
more about trunked radio systems.

Strong signals,

The NF2G Scannist pages have been updated again.

Most of the updates have to do with information that has arisen out of the CTIA-inspired Congressional witch hunt. The US Scanning Laws page has been updated and some supplementary pages have been added.

Other corrections and additions are listed on the main page.

I just purcahsed an RS PRO-62 on clearance for $180. Because it was the last unit I decided to buy it w/o doing any research on it.

Anyone out there have comments on your experience with this unit? So far it seems to perform well. At first I heard the NOAA freq at 161.190, which I had experienced with another triple conversion unit, but that has not occurred again for some reason.

Thanks for any help with this. I can always return it if it turns out to be a dud.

A-Yup, this one needs to go away. A (simple?) multi frequency,
digital code device can be built yourself if your so inclined to. Why
pay much more for something you only need if your into illegal doings.

Jerry

Intermodulation happens when a strong RF signal, at a frequency other than the one you are trying to receive, overloads a receiver. Generally it is the first RF amplifier stage that is overloaded. When overloaded the amplifier stage becomes non-linear causing distortion to all of the signals that pass though it including those on the frequency you want to listen to.

Intermodulation can be eliminated or greatly reduced by designing a high degree of selectivity (the ability reject these off frequency signals) into the front end of the receiver. Adding selectivity increases the cost and complexity of the receiver. Many (most?) scanners use a broad band first RF amplifier (very little selectivity) and are subject to intermod.

If you plan on using a receiver in high a RF area, it's susceptibility to intermod is an important characteristic. If, on the other hand, you won't be using it in a high RF area it is a far less important characteristic.

Most downtown and near downtown areas can be considered high RF areas. Generally the farther into the country you move the less likely it is that you will be in a high RF area. But with Cell and pager towers springing up all over it's really hard to tell nowadays.

Hope this helps,
John

While the FCC might be wrong, it was the opinion of the author of the ECPA (Rep. Markey D-MA) that modification also meant manufacture. He very clearly stated that during the open hearings two weeks ago. I would guess that the FCC knows where their funding comes from.

Regards.

Harold

a 3000xlt

how many MHz/second is a reasonable search rate?
searching 26-27 MHz, 5KHz steps...
w/o turbo: approx. 10 sec.
so: approx. .10MHz/sec.
w/ turbo: approx. 7 sec.
so: approx. .14MHz/sec.

i can't seem to get the math right.
supposedly 100 freq./sec. w/o turbo...
supposedly 300 freq./sec. w/ turbo...
how is a frequency defined for these claims?

w/ the standard 'rubber duckie' (?) antenna,
how good should reception be???

i have so far found several TV stations
and 26 FM radio stations.
not all stations come through strong and clear, thou.
i was surprised to get some images but have weeded them out.
there don't seem to be any other steady broadcasts...
...are there any other which i should have found?

i have also picked up certain conversations
to be heard around 440 MHz and 460 MHz. HAMs?
only three conversations at night of so-so quality.
how 'busy' should the airwaves be?

it would seem that daylight hours aren't as good for reception...
...for any wavelength...

for the CB range of frequencies i havn't heard anything yet. (?)

i am curious as to why my scanner seems to stop on so many frequencies
which are empty...my squelch is set as should be.? any comments?
i take that they are 'birdies' but not internal...should i up my squelch?

also, does anyone know why Uniden left out 550 MHz to 760 MHz???
what is to be found in that region?

I have purchased from Scannerworld in the past and have never had a
problem. I live in Western New York and the items I order from them
arrive in two days by UPS.

I have found that in recent years (2 or 3) that Communications
Electronics in Michigan have better prices and aslo deliver in a very
timely fashion.

I know. For $199 on sale (or $125 used) you can get their HTX-202.
Add a week of studying for a Ham ticket and you can be doing 5 watts
simplex or hit multiple repeaters. Or on the cheap side, for as little
as $40 you can pick up big CB handhelds that should be close to 4 watts.

The two effects I see the most are "cooking" the cells by overcharging
them and cell reversal by draining them too far. There have been a
number of articles published in ham magazines that claim that there
either is no memory effect, or more credibly, there is one, but you
don't encounter it outside of very repetitive charge-discharge cycles,
like satellites.

When you modified the radio, you depreciated its value substantially;
it's like taking a 59 Gibson Les Paul standard and drilling a hole in
it for a new pot and replacing the bridge/lead pickup, most people
know that a 59 Gibson Les Paul Standard in mint condition is worth up
to $60,000 on the auction block UNTIL somebody makes the grand ol
mistake of modifying its original form, then the price plummets
drastically, like all vintage axes do when people modify them, radio
equipment is the same way in aspects, especially now that the mods are
illegal for the radio's
Don't expect to get your asking price because I think most people are
smarter than that!!!

That works !!! Thanks for the suggestion. However, it's not working well. I am only getting small groupings of text, none fit together into bigger messages. The error rate must be very high.

I have tied the non-inverting input of my interface to ground and use a discriminator output from my scanner. I'm not sure what's left to fine tune.

Any other ideas?
-Bob

BTW: I'm using a PRO-2006

Actually, it seems to me that the way the law is written a manufacturer could market a receiver covering cellphone frequencies only with a VFO tuner to allow the user to bandscan with either digital or analog tuning but no scannable memory channels. Actually, since monitoring cellphones is sort of a catch-as-catch-can thing anyway, just manually tuning through the freqs. really wouldn't be such a bad thing. Of course, even though the receiver would be legal to manufacture and to own you wouldn't be allowed to use it!

2373. Re: FCC Says Cellular Mods Are Illegal

Newsgroup: rec.radio.scanner
Date: 1997-02-17 00:00:00 UTC
From: jtward11@aol.com
Message-ID: <19970217050101.AAA28517@ladder01.news.aol.com>
Source record: 207159

Folks, this topic - and others similar - are getting just too weird. It's clear that many subscribers to this board have lost touch with reality. The cellular companies DO NOT own Congress. Certainly, they have influence. But the strongest evidence that their influence is limited is the fact that scanners are still on the market. If the CTIA had its way they would have been outlawed years ago.
We need to focus our efforts, and our comments, on what is really happening and what is likely to happen in the near future. While the following represents only my opinion, it is an opinion formed after several long conversations with FCC officials, officials from the scanner companies and with several members of the House Sub-Committee on Telecommunications.

We are likely to see:

1. An amendment to the ECPA clearly spelling out that modifying a scanner to allow direct tuning of cellular frequencies is illegal. Enforcement against blatant violators, i.e. companies that advertise to perform mods.

2. The re-evaluation of some current scanner models, i.e. the AR-8000, and orders to the manufacturers to make design changes.

3. Adoption of image rejection standards for scanners to prevent monitoring cellular transmissions via "images."

4. Possibly the "hardening" of internal components by encasing certain circuit boards in epoxy or other similar substance.

None of these, as distasteful as they may be, will be fatal to the scanning hobby. But I do believe that the one thing that WILL be fatal is the continued monitoring of cell freqs. by scanner users who can't keep their mouths shut. It won't take too many more "John and Alice Martins" to deal this hobby a fatal blow leading to the banning of all scanners. People who insist on spouting loud and long about their "rights to monitor anything I damn well please" will also do more harm than good. Reverand Tweet is a twit, and is as dangerous to this hobby as any member of the Telecommunications Sub-committee.
Focus here, people, and when you write to your local Congressional Delegation members emphasize that it is important that if new legislation on this issue makes it to the floor of the house that they consider it with an eye toward protecting not only cellular users privacy, but also our ability to legally monitor police, fire, EMS, military, aviation and marine communications, among others.

OK, one last time for you obtuse folks out there.

Under the current law, possession of a scanner capable of tuning cellular frequencies is not illegal. It doesn't matter if the scanner was built before the ban went into effect on April 26, 1994, if it was imported into the country in spite of the ban or is a modified unit. It is not illegal to own a scanner capable of tuning cellular telephone frequencies. It is, however, illegal to USE it to monitor cellular (and cordless, for that matter) telephone conversations, whether those conversations are received by tuning the cellular frequencies directly, or by tuning "images" of cellular transmissions.

Now, it would be possible for the FCC/FBI et al, to seize a scanner if that scanner was considered evidence of the commission of an illegal act, i.e. the modification of scanners to tune cellular transmissions, or the use of a scanner to receive cellular transmissions. It would not be legal (possible, yes) for the government to seize a scanner simply because it is capable of tuning cellular frequencies.

I do not believe the FCC/FBI will target for enforcement the individual who modifies his own scanner to tune cellular frequencies, or the individual who monitors cellular telephone conversations AND keeps his mouth shut about it.

I think it is likely they will target any company that advertises that it will modify scanners to receive cellular frequencies, as well as companies from outside the U.S. that advertise that they will ship cellular-capable scanners to persons inside the United States. I believe, should Congress really turn up the heat, that they MAY investigate individuals who post or solicit scanner modification information on this or other internet sites.

I believe they WILL amend the law to make modification clearly illegal.

John

> >

Hi Bob and Ron:

I'll concur on the RS weather radio, but I wouldn't spend much
more than the $39 on a weather radio.

The reason for that is NOAA will be equipping it's VHF
transmitters with Selective Area Message Encoding (digital)
encoders. If you want to take advantage of it, buy the
cheapest RS unit that will do, then buy a "SAME" compatable
weather radio after the price gets reasonable.

Just my opinion...

Hey Drew, you aren't suggesting that some of us (gasp!) licensed hams would do a little bootleggin' would you? Why, I wouldn't even think of going down below 10 meters and talking to people that actually have something interesting to say besides the usual idiotic "you're 5-9 old man", and stupid weather reports, rig and antenna, see-ya-bye, over and out, ar, sk, bv, contest mentality. NOT!

Heck, a guy could lose his reputation as a techno-dweeb by talking to those dang freebanders for Pete's sake! Me, a licensed ham freeband? You gotta be kidding! OF COURSE I DO!

Lovin it,

Jon, KF7YN (except on freeband, then I fake it)

I work for a globally-known company that is a leader on GSM technology.
As a design and test engineer for GSM, I have to tell you that GSM was
designed specifically to avoid eavesdroppers and cloning. GSM uses
digital TDMA technology, and both the cell phone and the cell tower
cipher the digital data, so even if you were able to "capture" the
signal, you cannot decode any of it--much less hear any audio
whatsoever--no matter what kind of equipment you have. Add to this the
fact that GSM phones change frequency every second or less and you might
as well rule out any chance of monitoring a GSM call.
GSM technology started in Europe, but...

For any Americans reading this, be well advised that GSM is coming to
most U.S. cities soon (I am part of the North American development
team). Currently, it is being marketed as PCS-1900, as the phones
utilize frequencies in the 1900MHz band. Here's a kicker -- GSM meets
military specifications for secured wireless communications.....so much
so that the neither the FBI nor CIA even have the equipment to decode
the radio signals, no matter who they want to monitor. They have to
monitor calls at the landline control office. Perhaps this is why GSM
is also called "Second Generation Cellular".

Cheers,
Jonathan

a poor example.

1. most computers are made from FCC certified purchased parts.
in the case of a computer consisting entirely of purchased parts,
the FCC views the unit as a whole to be FCC certified.
2. in the case that a computer consists of certain (or all) FCC uncertified parts,
the FCC makes allowances for homebrew which A. does not cause interference.
and B. is not intended to be sold commercially.
3. otherwise the FCC would only take action if they
A. took notice of aforementioned (hypothetical) violation(s).
and B. felt prior notice warranted their consideration and involvement (time).

> Will the FCC go after every TV repairman who at some time substitued
> a 6BK7 RF amp with a 6BQ7 or 6BZ7, or a 1B3 HV rectifier with a 1G3?<snip>

yep. ;)
(but no, since they do overlook certain small infractions)
(and it is not in anybody's interests for the FCC to waste the requisite tax money)
(on such an ambitious and futile venture.)

That would all depend on conditon of the radios, how old they are, if they are modified or able to be modified, & what accessories if any are with them (antenna's, power supplies, etc).

It better lay gonden eggs for that price! Hell they only cost $349 when they were new. Give it a few more years until the new laws tighten up and you might get that price out of it.

Welcome to the club. My scanner (RS Pro 2020) picks up my computer on
156.800 MHz (VHF Marine Channel 16). Mostly the scanner picks up the
motherboard, mostly during boot-up, when the computer switches to
modes as HIMEM and EMM386 (and sometimes Windows) are loaded. The best
ways to stop this is make sure your scanner and computer are on different
power circuits, and they are a large number of feet apart (my computer
and scanner are about 12 feet apart.).

>
> i just got one, my first scanner. :)
> a 3000xlt

Congratulations...a very fine scanner to start with!

> how many MHz/second is a reasonable search rate?

Searching is accomplished by "stepping" through
the frequency range being searched. Different
regions of the RF spectrum have different step
sizes(5kHz, 10kHz, 12.5kHz, 25kHz, etc) so MHz/
second is not an accurate measurement. Manufacturers
usually give you the best steps/second the scanner
can achieve. For the 3000, this is 300 for 5kHz
steps and 100 everywhere else. It is unlikely
you will find anything that scans/searches faster
for this price range so don't worry about it.

> w/ the standard 'rubber duckie' (?) antenna,
> how good should reception be???

This will depend on your location, and the height
and power of the transmitter of the particular agency.
For the most part, you can expect 20-25 miles line-of-
sight using the BC3000's stock antenna for a "typical"
public safety system.

> i have so far found several TV stations
> and 26 FM radio stations.
> there don't seem to be any other steady broadcasts...
> ...are there any other which i should have found?

You might be able to pick up NOAA weather broadcasts
in the 162 range.

> i have also picked up certain conversations
> to be heard around 440 MHz and 460 MHz. HAMs?

440-450 is the 70cm ham band. 450-470 are public
safety, business and TV/news reporters.

> only three conversations at night of so-so quality.
> how 'busy' should the airwaves be?

A very subjective question which depends on the number
of licensed radio users in your area. You obviously won't

get as much radio chatter out on the range as you would
in downtown Metropolis.

> i am curious as to why my scanner seems to stop on so many frequencies
> which are empty...my squelch is set as should be.? any comments?
> i take that they are 'birdies' but not internal...should i up my squelch?

By definition, birdies are RF generated by the radio itself. To find the
birdies for you particular radio, go to an "isolated" location, set the
squelch at it's normal setting, remove the antenna and scan the entire
reception range. Make a list of wherever it stops. If the radio stops,
under normal operating conditions, on non-birdie frequencies, you are
picking up RF noise from other devices or non-modulated carriers(stuck
microphone, etc.).

> also, does anyone know why Uniden left out 550 MHz to 760 MHz???
> what is to be found in that region?

These is the UHF TV channel range. Uniden likes to leave this
range out for some reason(design, cost, whatever). One reason why
I like my Pro-26. If I'm driving around during news hour, it's
nice to be able to hear the local and evening news.

If you don't have one already, pick up a copy of Police Call at
your local Radio Shack. Lots of good info! Good luck!

Great article in this month's Popular Communications regarding "freebanding" or "outbanding."

Unlike most biased articles which tend to heap scorn on "those dirty outbanders", this one is very objective and tells it like it is. Accurately depicts the millions of freebanders, why they do it, the extreme unlikelihood of being caught, and ham radio's "dirty little secret"...that many licensed hams are also active freebanders because of the informal, less "stuffy" atmosphere on 26/27Mhz.

Well I, like some out here, got the software and am trying to build the small board
in the db25 hood. No luck at all. (Yes, I can solder well.) As a test I run PD.exe
and see no data from the 2006's discriminator. If I use the speaker output I see some
data (The little thingie spins on the display) but no decoding takes place. None.
I rebuilt the dumb thing twice. I *don't* want to pay the $65 L0pht wants for a premade interface because it's so SIMPLE.

Where am I going wrong? Has the 2006 some odd "feature" that I'm unaware of?
How about voltage? What value resistors have you used with the discriminator output of the 2006 (TP2) with good luck?

Waiting with frustration,

Matt

I doubt it! A MDT decoder would be illegal to sell under the ECPA. The
act not only covers cell phone, but also digitally encoded data. The
other problem would be as these are digitally encrypted they are as
such considered "munitions" so the ATF, and others would prohibit the
sell of such devices to the public. It's the same law that bans the
export of the new Web-TV to Canada, as somehow thev've received the
same classification....

Hi,

The reason that the TT does not follow non-800 Mhz trunking is due to the formula used to calculate the frequency. Hopefully, other TT's will switch to the appropriate freq when tracking Other Band Trunking (OBT) systems.

There are several OBT here in the Philly area:

Many SMR's and Utilities use the 900 Mhz freqs with 12.5 Khz spacing

Ocean County trunkes on 506/508 Mhz and Bucks County is considering trunking their existing 501 Mhz frequencies. Not know what system will be used by bucks though.

Mc Guire AFB and a Philadelphia based FedSMR trunks in the 406-420 Mhz range

Another drawback is the talkgroup identifiers are decimal instead of hex as they should be. This has the potential for creating problems on some newer Type II systems.

Otherwise, it is a good first product from Uniden and an Excellent innovation. Hopefully later products will be better.

Joe

That's an interesting question. The crypto export regulations are
very broad (and very vague). Such a CDROM could be considered a
cryptographic device, and thus be banned from export.

Having sex in the bathroom....with the headphones on intercom?!!
Please...dream on if that's what your into. Who the heck wants to even here two hamburger flipping kids doing it in the bathroom? What are the chances of that actually being heard. 1st, you would need two employees, who happen to be wearing headsets, who happen to be somewhat small so they can fit in the bathroom together, who happen to leave the intercom on so the poor saps wearing the other headsets can hear them, who happen to have a boss who wouldn't notice, who would happen to have no one at the drive thru (except for the guy with the scanner) in which case they would have to hurry out of the bathroom so they can take your order (they are the one's with the headset's right?) What are the chances of that happening...get real.... you would have better luck listening to the President on his cordless phone ordering pizza.
I am certainly not knocking the scanner community but there must be much more interesting things to listen to.

I did like to comment about DES baby monitors being undecodable!

Bob

>

Ah, yes, and if you look at the figure on page 6, the "E" has a jumper
at W301, while the "E3" does not, And in Table 4, the TX-RX Unit number
for the "E" is X57-4402-71, while the "E3" us X57-4402-73. Do the X57
indicators imply the configuration of jumpers and/or diodes, or
different firmware? Things may be more comples than just moving diodes
and cutting wires. It's confusing (probably on purpose).

2440. Meucci Replacement Shaft

Newsgroup: rec.radio.scanner
Date: 1997-02-18 00:00:00 UTC
From: cgafah@eden.rutgers.edu
Message-ID: <330a01e8.15432853@news-nb.rutgers.edu>
Source record: 206896

I have been playing pool for quite awhile now, and it seems I need a new shaft for my cue. I was told that I have to send the whole Butt to Meucci so they can perfectly match a shaft to the Butt. Is this true or is it a ploy? If it isn't true, should I order a shaft from Meucci directly?

Thanks in advance
Craig

Hello everyone,

I've been looking around a little bit to see what I could find out about GE / Ericsson's EDACS trunked radio control channel protocol. Although I didn't find enough information to allow one to decode talkgroup and frequency assignments, I think I did come up with enough to allow someone to receive outbound control channel messages. Perhaps someone else can then figure out how to interpret these control channel messages and be nice enough to post their findings and perhaps even design and market something like a "Trunktracker" board for EDACS systems (and while you're at it please make it do Motorola trunked systems too, and also act as an decoder for Motorola and Mobitex mobile data terminal transmissions, POCSAG/GOLAY/FLEX paging, CTCSS, ACARS, subaudible signalling, digitally coded speech, et cetera).

The control channel data is transmitted over the air at 9600 baud using Gaussian Minimum Shift Keying (GMSK). The upshot of this is I think it should be possible to receive the control channel using something as simple as the clipping circuit used to receive Motorola's trunked radio control channel or mobile data terminal transmissions. It would probably be a good idea to use Dejanews or Altavista to find postings giving more information on those Motorola systems since they explain some of the same things I'm going to talk about here. It might even be possible to rewrite one of the posted Motorola programs even though the coding and commenting style of the original writer will probably make you slowly rip all your hair out of your scalp.

Like any other digital system, there has to be some way of letting the receiver synchronize with the start of a transmitted message. This is done by regularly sending the following 48 bit synchronization sequence:

Sync Sequence : 000101010101010101010111000100100101010101010101
(or 155557125555 in hexadecimal notation)

Every time one sees this sequence in the received bit stream one knows that the following 120 bits form a transmitted message. In order to increase the number of messages transmitted each second GE decided to send the sync sequence before only every second message. So the

transmitted data stream looks something like:

Frame sync, message slot 1, message slot 2,
Frame sync, message slot 1, message slot 2,
and on and on it goes

Some important system status / information messages will be repeated in both message slots.

Now that one knows how to pick off the individual messages off the air one must convert each 120 bit long message into the 40 information bits. This turns out to be really easy: the 40 information bits are sent in order repeated three times. The second time all the information bits are inverted. Effectively one has a really primitive and wasteful error correcting scheme - in the received message invert bits 41-80, then read off the information bits given by bits (1,41,81), (2,42,82), (3,43,83) and so on. If no receive errors occured then all three bits in each position will be the same. If an error occured just ignore that bit that doesn't match the other two. I'm not sure why the system designers didn't use some sort of convolutional or block error correcting code which would require much less overhead (maybe the designers had been smoking a little too much of that wonderfully wierd wacky weed).

One verifies that the received information bits are correct with a cyclic redundancy check. There are 28 actual information bits while the remaing 12 are the transmitted CRC code. One can calculate the CRC code using the following procedure:

1. Load a 12 bit register R with hex 7D7
2. Zero the 12 bit CRC register
3. If the information bit is 1 then
XOR the CRC register with R
4. If the rightmost bit of register R is zero then
shift R right by 1 bit, otherwise
shift R right by 1 bit and then XOR with hex A9C
5. Go back to step 3 until all 28 information bits
have been processed.

This calculated CRC should match bits 29-40 of the message or else the received message must be considered invalid.

At this point I've pretty much exhausted all of my information sources. I don't have any information on how the 28 information bits are formatted or translate into frequency and talk-group assignments. I would imagine that anyone who gets a decoder up and running for an EDACS system should be able to figure such things out in relatively short order. I also don't know whether or what information an EDACS system sends to mobile data terminals over a trunked system control channel - some literature seems to imply that the trunked control channel signalling can be used for more than just handling the trunked radio system.

Finally, this has been posted semi-annonymously in an attempt to deflect unwanted attention from various corporate or governmental security apparati. While I do not believe any of this information is confidential I do remember Henry Kissinger saying "Even paranoid people have enemies."

Incomplete as it may be, I hope this information has been of some interest. Maybe someone else knows more or can pick up the ball and do something practical with it. Please let us know what you find out.

This is getting just a bit extreme and foolish. I'm not apologising
for a stupid law; *BUT* this is not where things stand today.

If you folks want to bitch, there are 525 members of Congress. Write
a very clear letter telling them exactly what's wrong with the ECPA
and make it clear to them that this is a law which says don't look at
the naked emperor.

This isn't the FCC's doing, folks. Even they know better than making
dumb laws like this.

>Ace Communications got a $20k fine for selling these radios. Evidently
>they didn't have the FCC's permission yet to release them. How do you
>like the radio?

I did not purchase this radio through ACE. I had a bad experience
with them many years ago, and have avoided them like the plague since.

I am generally happy with this radio. It has a great RF section, and
seems fairly immune to images and overload. The squelch seems to
work a lot better than AOR radios, and it is not that difficult to
program.

However, there are a few software problems that have been bothersome.
The most frustration one is the lack of any way to overide the
2 second delay. This delay makes it almost useless to monitor
trunked systems that place a trailer on transmission.

Another minor annoyance was the light switch. The switch MUST be
held on for the light. You needed three hands to program the radio
in dim light. One to hold the radio, one to press buttons, and one to
hold the light switch. I solved this problem by removing the switch
and replacing it with a jumper. The light is ALWAYS on now. It reduces
the time between charges, but not by enough to make it noticable.

Other minor complaints:No serial port (1000 channels take FOREVER
to enter manually), and the batteries cannot charge while the radio
is on.

Other than that, it is a good radio. However, most of our local
services have gone trunked. Because of this, I have been unable
to use this radio for local monitoring. I have had better luck with
an AOR3000 (no delay). One of the reasons I need a schemo, is to
build a curcuit that can override the built in delay. If I can do
that, this radio becomes much more useful.

ENJOY

Richard Rosa

Hello, `
I am selling a Bearcat programable scanner Model 210. This is a 10 channel scanner. I think the first programable that Bearcat started with. Anyhow, it is in very mint condition and really plays well. I have no real use for it. If you are a collector, or just need a second programable around, this will work. I will sell it for $65.00 or B/O You pay S/H. All prices negotiable.

Rich,

You had nothing I actually quoted in there after being snipped so many times, you have misquoted me! Nowhere did I say what is appropriate for anybody but myself, I made the comment fast food monitoring is a yawner, and then I retracted the statement in good humor.

Don't lecture me about personal choice and hobby protocol, I've been at this as long as you, and I have done my share of letter writing too in support of our rights. I've edited scanner newsletters just like you Rich, I know what's going on here as much as anyone. Lighten up for Pete's sake!

Happy scanning,

Jon

Thank you William for the post-

These are indeed correct.
The newer US versions of the radio have a different processor that
will not allow the extended coverage. No doubt a request-demand from
our wonderful government.

Just about any scanner will pick up interference from a computer or other electronic device. The best thing I can recomend, is to move the scanner farther away from the HD on your computer, and possibly install an outside antenna. I did both of these and reduced my interference almost completly. If you bought the Pro-2039 you most likely bought a good scanner. Good luck, and happy scanning.

I AM GOING TO SENT YOU THE MOD FOR THE ADMS-1 SOFTWARE FOR THE FT-51.
THIS SAME MOD SHOULD WORK FOR THE FT-50 SOFTWARE, JUST REPLACE THE NAMES
RESPECTFULLY. EXP WHERE IT SAYS TO GO TO FT51 PROGRAMMER IN MY MOD YOU
WOOD GO TO FT50 PROGRAMMER. I HAVE NOT TESTED THIS MOD. IN THIRE IT
SHOULD WORK BUT BE CARFUL

MOD FOR THE YAESU ADMS-1 PROGRAMMING SOFTWARE FOR THE FT51R, FT11R,
FT41R.

This mod will let you change the ADMS software so you can program any
freq. into your HT. 60mhz - 999mhz

1. Load the program per the instruction.
Play win the program and get use to the way it works.

2. Make a template of your radio.(Follow the directions that came with
the
software.) Or simply upload your radio's memory to the ADMS software
and name it STOCK.RDS or what ever you feel. If you are using this
software for all 3 models of HT'S, you will need to make a template
file for each model.

3. After you have made a template of your radio, close the ADMS
program.
Exit windows. Then restart windows go to file manager and bring up
your windows directory. Double click on file WIN.INI Scan through
the file (BE CAREFUL NOT TO MAKE ANY CHANGES TO ANY OF THE FILE)
untill you see the line that says [FT-51 Programmer] of if your
radio
is the 11R it will say [FT-11 Programmer] the same goes for the 41R

4. Next find the line that says AllowAnyFrequency=0 and change it to
say AllowAnyFrequency=1 Now click on save and exit NOTEPAD WIN.INI
Thats its.

5. Exit windows then restart windows. Click on your Yaesu Programmer
icon
you will now be able to program any freq. (60-999 mhz) into memory.

NOTE: This mod will not work on the shareware ver. that was handed out
at DAYTON-95

Have fun and enjoy

That is what is criminal about cell phone companies..I pay
a buck a minute and up in Sacremento they pay .26 per.
In the San Fran area i am paying 1.00 a minute for my plan.
but only 20cents per minute on weekends and overnight...is
when i use my cell phone the most....

but look at the differentials.

the part this played in the original answer was that the
cell phone companies buy off congress to do their bidding.
the reason they can afford to but into Congress is because
of the MONOPOLISTIC practices of charging an arm and mind-stem
for the privilege...then plus that charging a base fee of
22 bucks or 42 bucks to use their lines...

no competition. Maybe this new Phone Agreement with the world
will open up the lines to cell phone rates charged by other
countries here in the US....

>[[Bill,
>
>I don't understand what your statement has to do with the FCC and
subject
>at hand.
>
>Also, I wish I could receive cell call rates like you, my rates are
$.65

>

>RR
Sacramento gets prime for .26 per i am told
San Fran gets prime for .45 / .30 on two plans
based on which plan you choose

other markets prices vary...the use fee really gets high.

2457. do all 900 mhz phones suck?

Newsgroup: rec.radio.scanner
Date: 1997-02-18 00:00:00 UTC
From: soundorg@airmail.net
Message-ID: <soundorg-1802971730260001@dal48-21.ppp.iadfw.net>
Source record: 206913

I've tried several 900 mhz phones, and they all sound far worse than my AT&T 5000 series analog phone. Sure, the range is better on the 900mhz models, but the sound is awful. Very artificial, with a strange echo.

Is it just me, or is this a recognized phenomena? Does anyone who has experienced the same thing know of a model that doesn't do this?

Thanks for any feedback!

-Mark

Len:

If your 900 Mhz phone is *digital* using spread spectrum technology, no
scanner currently available commercially can here your conversations.
There is no such thing as a digital scanner.... yet...

Regards,

Sean

GSM is a digital type of cellular phone. It also uses frequency
hopping. You are not going to be able to pick it up well, nor
are you going to be able to decode the signal.

> em Anne Arundel moved to a totally 800 mhz system a couple of years back.
They are using a Motorola Trunk system on 856.3625 thru 860.3625 and
856.3875 thru 860.3875. Fire dispatch relays are on 154.01. Police,
Fire, EMS (including the city of Annapolis), jails and others are all on
this network. All this is analog, but how long that is going to stay
around is guesswork, since Baltimore city (which adjoins AA county) is
going 800 mhz digital APCO project 25 shortly.

Source record: 206931

Rather than spend our time ranting and raving about the latest threats to scanning, which is nothing but conjecture if you think about it, let's get our respective shit together as hobbyists and make our voices heard!

The Cellular Telephone Industry Association has a website at:
http://www.wow-com.com

Let them know what you think of their self serving multi-billion dollar business trying to outlaw all scanners, the vast majority having nothing to do with cellular phones. They seem to think all scanner users listen only to cellular phones, or at least that's what they are telling Congress.

I just let them know that I refuse to renew my cellular contract until they back off the scanner issues that don't apply to cellular. Their response will undoubtedly be "wah" until enough of us do the same.

Let the FCC know what you think. Let your Congressional Representative and Senators know what you think.

Bitching at each other here serves no useful purpose other than to bolster a few egos here and now. It's tomorrow that counts folks, write, call, fax, email and be heard! If we don't do this now, we deserve whatever the CTIA clowns and Congress do next.

Happy scanning,

Jon

It's not the food orders that most people want to listen to. The employees have a switch on their headsets that allow them to communicate with each other internally. You would be suprised at what you can hear!

If you get a chance, you should check out the August and November issues of Monitoring Times. They contain articles on Fast Food monitoring.

The article in the August issue of MT can be viewed online at:

I agree. The discone is well worth the money! It does a good job from
100 mhz to 1.3 ghz. The low band isn't to hot....but I don't listen
there much. I hear the Diamond discone is better. You can get a whip to
go on it to improve the low band.

The following list was obtain from the following site:

ftp://oak.oakland.edu/pub/hamradio/docs/misc/scanner.faf

Cellular Telephone [22.902]

Chs Freqs (base) System Use

991-1023 869.040 - 870.000 A - RCC voice |
1-312 870.030 - 879.360 A - RCC voice
313-333 879.390 - 879.990 A - RCC data
334-354 880.020 - 880.620 B - Telco data
355-666 880.650 - 889.980 B - Telco voice
667-716 890.010 - 891.480 A - RCC voice
717-799 891.510 - 893.970 B - Telco voice

Transmissions are FM. Channels are 30 kHz apart. Mobiles
transmit 45 MHz below the base (824.040-848.970) and are usually
repeated by the base.
Channels 991-1023 are also identified as Chs 800-832. |

The following list was obtain from the following site:

Hey remember theres a Fiberal sorry Liberal in the White House not in
Congress
which is controlled by Contakatives sorry Conservatives. Both parties have
lost their
minds and my trust. Though I must admit I never trusted Liberals very much.

My opinion only.

I just bought a RS Pro 2039. When it scans, it picks up the computer fan on some of the channels I programmed into it. Is there anyway to stop this? Should I get a different scanner? Any suggestions appreciated.

Thanks

You dudes need to get a life! Our government has better things to do
than to come to our homes and take a legally modified scanner!! Jesus
CRIST! As for the gun issue I to own guns for hunting but I do NOT
think that every has "the god given right" to own a bazooka or laws
rocket or other weapons like that. And if you don't like it here go
join your right wing buddies in another country! Athough I don't know
where. Quit listening to Rush.

The description of 'lord@heaven.com' being a hacker is obviously BS. More likely an ex-Motorola employee.

Labelling him/her a hacker is a good way to paint 'em in a negative light.

The fact that they used such a handle is bad enough for me. But the code works as advertised.

By the way, what is the lead time for that magazine? If it's very long, maybe they were in on it.
cheers

Tom,

I don't know where you live, or which group of NORAD frequencies you monitor, but here in Central Florida there's quite a bit of activity on several of the frequencies for the Southeast Sector.
The freqs. are particularly busy when out-of-town fighter units come down for training and work air-to-air combat with the AWACS from Tinker AFB. Although most of the freqs. are quiet most of the time I have heard radio checks on all.
The NORAD freqs. I monitor are:

228.800 234.700
238.500 364.200
251.000 256.600
263.200 270.400
275.000 278.600
292.700 298.500
302.400 306.400
325.500 338.400
344.000 356.000
369.100 375.100
386.200 392.800

Hope these help you out.

John

Sure - It's sound activated. It only records when there's sound. Also,
since the recorder has to start when it hears something, it prevents
the beginning of the first spoken word from being clipped off.

>Look carefully at Table 2: E receives 144-146 and 430-440, while E3
>receives 67-180 and 400-512 MHz.
Which is *exactly* my point: the receive ranges differ, yet the diode-matrix (D302-D308, labeled 'Destination diode' in table 2) is exactly the same. These diodes tell the unit how to behave. Now if the E and E3 units have the same diodes, how can they behave differently?

Note that I feel the documents contain a wealth of information,
I was just hoping to keep anybody from opening up his/her handheld and moving diodes, only to find out there is an error in this table 2. The TH79 is to precious for that.

> It appears there is no way to get the 800 MHz band on "K" (U.S./Canada)
> models, which should make Newt Gingrich happy.
Still, I see TH79A's advertised WITH 800 MHz in various newsgroups. As I understand it the older units can receive 800, but the newer ones can not. I somewhere read in an article that you can see this from the serial number:
===If your serial number is 603XXX or higher, that is all you will get. The
===TH-79A that I have posted is 602XXX
I cannot find the original article though- you'll have to search the net for it.
There may be a NOSPAM. in front of my E-mail address.
It is there to fool machines, not people.

I have a printout of DA 97-334 (found at http://www.ggw.org/nf2g/), the
official notice from the FCC concerning modifying scanners to receive
cellular frequencies.
It specifically states that such modifications, *"on a substantial
scale"*
amounts to manufacture of scanners able to operate on cell freqs.
This would seem to say that individuals modifying their own scanners
are not violating the law.
I'm no lawyer.

> Is it possible for a hand held scanner to reach 30 miles to pick up a cordless phone?

Possible, yes.
Probable, no.
By this, I mean that the circumstances must be very right for this
to happen. The receiving antenna must be *very* good, the terrain
must be favorable, and the scanner must have excellent sensitivity
(not a common trait in handheld scanners).
Signal strength of cordless phones is so low that such reception
is very problematic. It *can* happen, but not often. Usually,
such interceptions are at a range of under a mile.

Thank you for this commentary. It is not up to one or two individuals
to decide what is and isn't appropriate for the rest of us to listen
to. It is purely a personal choice and may even be the reason for
having started this hobby. A hobby that, these days, needs as many
supporters as it can find seeing as how there are a growing number of
people in our society and Congress who deem it necessary to
collectively label us as misfits or borderline-criminals.

Strong signals,

Since John Kesling wrote an excellent explanation, I
will not go into one myself.
However, I think you have gotten the radio or term
confused somehow. The BC9000 is designed quite well and
shows few signs of intermodulation. The standard for
this category, against which many base receivers are
compared to, is the Pro-2006. The BC9000 comes up just
a notch or two behind it..so you really have nothing to
worry about w.r.t. intermod. Or put another way, you
could do a LOT worse than the BC9000.

Unfortunately, it is impossible to pick up cellular telephone freqs in Connecticut. There is so much iron in the soil that the freqs are absorbed soon after they are transmitted from one cell site to another. The only reason it works for people who are using cell phones is that they keep moving. In fact, it is well known that if you don't keep moving, the cell phone conversation will fall to the ground before it reaches you. Your only option is to move to another state if you want to hear cell phone conversations.

Maybe someone needs to rap his fingers. Grove has been operating under
what has been percieved as a loophole in the ECPA scanner laws.
Certainly in violation of the spirit o the law. The "service" he has
been selling can be linked directly to the current threat to to
monitoring in general.

A relay to CH-16 in the NYC Metro area probably doesn't exist, because it isn't needed. Relays are often utilized in areas where hills/mountains inhibit transmissions. NYC area has no such problems, so no relays needed. Just my opinion.

WinTone 1.51 Real-Time DTMF decoder/Scanner monitor for Win95/NT is now
available, and it runs 50% faster than before - Making it run great on
most 486 machines! Here are some of the features that are available :

* Real-Time DTMF decoding via your Sound Card
* Extensive Tone Logging/Transformation
* Decoding DTMF tones from WAV files
* Squelch controlled Scanner monitoring to a WAV file
* DTMF Triggers - Launch an event when DTMF tones are heard
* On-The-Fly Save to a WAV file while you are decoding
* Tunable options to fit tyour listening environment
* NOW 50% FASTER - WILL RUN ON MOST 486 MACHINES!!!!

Come take a look for yourself - You wont regret it!

And they just happen to be activists in the Democratic party, right? I
could
not believe how naive they must think we are when I saw the press
conference
when the Martins were explaining how innocently this all happened. They
just
like to record stuff off the scanner and listen to it later and let the
relatives listen to it.

If they are not prosecuted for the federal law violations, I guess we
can
assume the laws mean nothing.

If anyone needs their fingers rapped it's the FCC because Bob Grove has repeatedly informed the FCC of Grove's modification policies and asked for guidance accordingly. The FCC told Grove they saw nothing illegal so Grove WAS operating within the spirit of the law. Grove's integrity is second to nobody, he always has and always will abide by the law. His service isn't what is threatening the monitoring hobby, it's the goddamn politicians, lobbyists and the CTIA, the Cellular Industry "Lie-at-all-costs" scumbag low life pieces 'a shit who are threatening our hobby.

> Appreciate it.

The Sony PRO 80 is not really a scanner. It does VHF only and only with the adapter attached to the antenna jack. You also have to open up the battery compartment, remove the battery holder and move a switch.
Actually the PRO 80 is a great little SW portable although it tunes in 5 kHz increments it does have fine tuning and can do sideband.
As far as scanning it is VHF only and will hold 40 maybe 50 frequencies, I can't remember for sure. It also scans very slow. And like I said you have to go thought a lot of work just to change from VHF to SW or visa versa.
If you want a good SW portable, it is a good choice although the ergonomics are a bit odd. As a scanner there are far better choices.

Greg Renner

We use Uniden Model EXP900 where I work. We've got three of them. They are 40 channels, voice scrambled, blah, blah, blah. They work great. Even when all three of us are in the same room there is no interference. They have a least 1/4" range here in the factory where we use them. They seem to be workhorses. I saw an ad in one of the papers last weekend for this model for about $150.

Dave K. wrote:
>
> Does anyone have experience or knowledge of the commands used to program
> the memory channels in the IC-A22 aviation transceiver?
> The Icom 'parts guy' doesn't even know that this can be done.

Dave,
From the IC-A22 manual :
1) Push CLR
2) Enter the desired frequency
3) Press F
4) Press MR/MW
5) Select memory channel using keypad or rotary selector
6) Press
A) ENT to enter frequency with no alpha-tag
B) To enter an alpha-tag for this memory :
Press MR
Press 1/2/3/4/5/6/7/8/9/0/MR one or more
times to program the text. Use the up and down
arrows to move to positions
Press ENT when done

When entering an alpha-tag, MR is used for a hyphen and
can only be entered in the fourth character position.
Hope that helps!

Does anyone know the freqs for Time Warner in the Winston-Salem, NC area. They used to be called Summit Cable. All I can find are old freqs like 462.125 that they don't use anymore. I think they may have went to 800mhz. Thanks for any help.

: Intermodulation happens when a strong RF signal, at a frequency other
: than the one you are trying to receive, overloads a receiver.
: Generally it is the first RF amplifier stage that is overloaded. When
: overloaded the amplifier stage becomes non-linear causing distortion
: to all of the signals that pass though it including those on the
: frequency you want to listen to.
(...)

Not exactly...
The first RF amplifier is capable of mixing two signals by:
1. Clipping on the input.
2. Hitting the power supply or ground on the output.
3. Running out of current and distorting the signal.
These happen, but overload of the following mixer stage is
much more common. Even if the two mixing signals are amplified
by the RF amplifier without distortion, the mixer needs to handle
much more power than the RF amplifier. It's the first mixer
that usually creates the intermodulation mix. The crystal filter
following the mixer will usually remove one or both of the
undesired signals.

Just because you're hearing intermod, doesn't mean that your
scanner is the cause. Intermod can easily be generated by
two transmitters in close proximity where a transmission from
one transmitter mixes in the RF power amplifier of the other.
Commercial transmitters in congested sites usually use
isolators (a circulator with a dummy load) to prevent any RF
from going backwards from the antenna to the RF power amplifier.
The best way to test for this is to use two DIFFERENT scanners
listening to the same frequency. If both hear the intermod,
it's probably being generated at the transmitter. If only one
hears the intermod, that scanner has a problem.

Another great way to create intermod in a receiver are in the
switching diodes used to switch filter frequencies and amplifiers
in the front end of most scanners. These PIN diode switches
need to have a considerable amount of forward current to prevent
a strong RF signal from turning them into a mixer. This is usually

the case with AC powered scanners. However, battery operated
scanners like to save current and these diodes may be the culprit.

>it.

Those were my words in response to a question about modifications to a
BC200XLT. The latest 200xlt that I modified had a surface mount resistor.
The date code was "OAID". Somehow in the back of my mind I think that it
may have been one of the last date codes that were modifiable. The regular
modification of removing this resistor proved to work very well. I would
attempt to do this first. Whether it is a carbon resistor or a surface mount
it is in the same place. Bill Cheek's mod is the same up to this point then
takes it a step further by changing the logic state. If you are aready going
to get the Ultimate Scanner book then it will be alot better than what I
could refer to you off the top of my head. Also, I respect Bill alot and
would not divulge information that he has worked to obtain without having

his permission to do so.
Bottom line, just do the regular mod of removing the 100k resistor above the CPU and see if it works. If it doesnt, then go get the Ultimate Scanner book and find out what crystal you need to order for the scan speed mod, read up on the battery indicator mod and find out what you need to do the 3rd mod to receive cellular frequencies. Another tip, the BC200xlt scans the cell frequencies in 12.5kHz, not the true 30kHz steps....that will save you another few minutes of head scratching.

Lawrence,
This is a good mod. Actually opens up from about 6MHz to 1000Mhz, but
the only things that interested me was the CB frequencies. You dont loose
anything in this mod. Even though you use the keylock switch to get you into
the mode to get you initial frequencies to work with, it DOES NOT render
your keylock useless for its intended purpose. You definately need to get
a different antenna for CB and SW. If you are truely interested in SW, I
would suggests getting a simple Yacht Boy or sumthin' similiar.

Lets see...RS Pro-2036. Off the top of my head I think that it is manufactured by Uniden and is only dual conversion. If it was mine I wouldnt even mess with the mod, just listen to the cellular images. You will find most of these from about 896 to 915Mhz. Find them with search and add them if you can easily hear both sides of the conversations. Sometimes you will hear one side on a certain frequency and then the next time that frequency is active, you hear both sides. Look up a cellular phone diagram, (you can find one in Bill Cheek's Ultimate Scanner Book and other places) and slowly map out the surrounding cells. You then can add them in without actually having an active frequency...the main problem is the Uniden is going to step in 12.5kHz steps during this range. It may be different with the 2036. I hope that this helps.

When I am using my Microtek E3 scanner, I can clearly hear my wife on the cordless phone like she is in the next room. I can also hear her talking on the cellular phone. By the way, it is now only $199 and gets great imaging also.

I have a Pro-2035, and the only wiring required was soldering 2 wires onto the receiver board, and plugging in 6 connectors. Quite simple. There was, however, a need to "nibble" out a section of the steel back panel, but that was easy. I think the 2006 install should be comperable.

>
>2) What software is recommended? I have a 133MHz Pentium computer with

>standard radio signals.

I'm using Probev2.0, and LOVE it. I have a P133 as well, and I run it in a DOS box in Win95, and get about 105 channels per second. Probe is also the *only* software I've been able to get to reliably decode DTMF. All others choke. Email me for more info on Probe.

>
>I intend to use this radio with an external antenna to improve reception
>and to reduce the possibility of computer interference through the RF
>input.

Great idea. I have my scanner sitting about 2 feet away from my monitor, and the antenna about 5 feet on the other side, and it DOES pick up computer noise. I live in a dorm, so I can't mount any outside antennas, but you can bet I will whenever I can.

>
>I would appreciate comments from anyone who has this configuration and

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have been looking into getting a scanner for computer control. I have read Bill Cheek's Ultimate Scanner about three times and looked at all the info through the internet on the Optoelectronics and the WinRadio. It all looks good and each have their specific benefits. I have been having a little trouble trying to find a good Pro-2006 at a resonable price. That could open up several mods and allows me to go with either the CE232 or the Opti456. Has someone done both these mods in one box along with mods for SCA and data squelch?
Finding a 2035/2042 would seem a better bet. But then it doesnt allow for the full two-way interface with CE232, but then can use the Opti535. If you use a Opti535 bought outside the US to enable cell frequencies, does this allow you to scan these frequencies if you do not have it connected to your computer?
I also have looked at the AOR8000 and some of the other scanners that do have computer interfaces. Nope the new Yupi does not have the computer interface and still has a delay after transmission ends. It is shorter but is still there.
Next, for the WinRadio. Is there someone out there that has some $$ and tried more than one of these avenues. WinRadio looks good, but is there enough ppl out there adventurous to keep it going for several years down the road?
Looking to hear from a few ppl that have tried several of these scanner/computer combinations. Thanks in advance to all who reply.

19/02/97 -- I am pleased to announce the availability of a
demonstration version of the MS-Windows application for the AOR
SDU5000 spectrum display unit.

The demo is limited to 10 minute periods of operation and has video
recording disabled.

Further details of AOR Hawk 5000 are available at:

http://www.sapphire.win-uk.net/products.htm

The demo may be downloaded as:

ftp://ftp.demon.co.uk/pub/ham/scanner/sdu5000.zip

AOR Hawk 5000 is available from AOR (UK) (info@aor.co.uk) and
internationally.

I think you are not being a very good shooper. Welcome to Economics 101.

There is competition in the San Francisco cellular market. There are TWO (PUC and FCC regulated) cellular carriers here. What you appear to dislike is that they are charging what the market will bear in this area. Cellular providers are now competing with PCS providers in this area as well.

The cost of cellular service has gone down in the bay area since it started about 11 years. I was in the cellular busniess (with a dealer) about 10 years ago. Back then the rates were $45 per month AND .45/min peak and .20/offpeak. The barebone generic rate plan (which nobody buys anyway) may still be at those rates but then if you figure inflation, the true cost has gone down.

I pay $33/month, .305/min peak and .14/min offpeak on a commercial account with Motorola. There are package available now to anyone that allow you unlimited offpeak calls for a flat rate in addition to whatever bundled packe you buy. There are other deals that keep the cost down as well. NOBODY has to pay $1 per minute on their home system in the bay area. If you are paying that much - you must be on a rate plan that gives you something else at little or no cost, like monthly or off peak airtime.

Since last year in California the cost of aquiring service is cheaper. Before then, "bundling" service with equipment was illegal in this state. That was why you didn't see ads for "free phones" when you signed up for a minimum service like you did in other states. The cellular companies fought to eliminate the bundling restrictions. So now in California, like many other states, you can go to a store and wak out with a new phone for the cost of establishing a account with the carrier. Bt then you have to pay to use it - "Pay to use a service" what a concept.

Another change fought for by the cellular coampanies was easing of tariff filing requirements. In California, the cellular carriers had to file all new rate plans so far in advance (and in public) that there was

no way for them to come up with competetive marketing strategies. No they can. That fosters compettion because there is no longer an inherent system of price fixing.

The cost of PROVIDING the service is different from market to market as well. If you think that the cellular companies can put up cell sites wherever they are need with no trouble, think again. I can tell you first hand that the infrastructure in the bay area cost more than Sacramento,or Omaha, or Des Moines... I was a party to placing a cell site in the east bay. The local governement will not let new towers go up where they are needed - this means the companies have to find ways to rent space (at premium prices in many parts of the bay area) for their equipment. Monthly rent for cell site space in a premium location (and they need them where the csustomers are) can easily run four digits - and that is just rent for space. I tdoes not include the cost of equipment, power, technicians (labor costs more), and other infrastructure costs.

But again the biggest reason is that the market will bear the price they are charging. Their growing business proves that there are plenty of people that value the service even at current rates.

I believe that if it has the B on the end of the part number, it can't be modified. I've got one and have tried. On the older models (sans B) there was a jumper that you could cut to open up the freqs but I have yet to be able to do this with mine.

One night on a road trip we pulled into McD's. Had the intercom line / order window freqs going, natch, as we hit the drive through. In front of us is a car of 4 hispanic males. They place their order. Next, we hear the pimply faced cracker behind the window telling his co-worker how he's going to screw up their order, and then tells his pal how he's giving the "spicks" small fries instead of the large they paid for.

Well, my wife is half spanish and she goes through the roof. When we pull up at the window my driver (an off duty police officer) asks to speak with the manager. Pimples looks sad. My buddy explains to the manager that we've been listening to the order window and quotes to him what we heard.

The manager goes nuts; "God damnit! I've told those kids and told those kids a million times that people can hear what they are saying from a mile away, and as for the short changing and the racial slurs, don't worry, I'll take care of it". Manager grabs pimples by the scruff of the neck, last seen heading towards the managers office as we speed off into the cool air of another Illinois night, munching our fries and snickering...

Happy Scanning

The Congress isn't satisfied with holding hearings to remove more of the frequency spectrum from scanners, now I've discovered that there is a police lobbying group in Washington attempting to have all of the police frequencies, including the local government frequency ranges, removed from a scanner's ability to monitor.

Ladies and gentlemen, please write (do not E-Mail or FAX) both your Congressional representative AND your senator requesting they vote against any further restrictions on scanners and manufactures.

On another interesting note, the Low Orbital Satellite companies were not satisfied with trying to suck up the 2 meter and 70 centimeter ranges of the amateur spectrum, now they've decided THAT is not enough either....they want the 200 MHz amateur bands INCLUDING the 2 meter and 70 cm amateur bands.

From the ARRL:

ARRL Web: Threat to 2 Meters, 70 Centimeters

RADIO AMATEURS MOBILIZE
AGAINST THREAT TO 2 METERS,
70 CENTIMETERS

FEBRUARY 14, 1997: [*]Comments needed by March 4! ARRL Opposes
"Little LEOs" effort to include 219-225 MHz
January 17, 1997: [*]Little LEOs Narrow 2-Meter Focus
Excerpted from The ARRL Letter, February 14, 1997,
Vol. 16, No 7.

Commercial satellite interests seeking access to bands below 1 GHz--including amateur allocations at 146 and 430 MHz--now have added 220 MHz to their wish list. For the first time, Little LEO (low-earth orbiting satellite) interests have proposed including 219-225 MHz in their list of desired allocations for the non-voice, non-geostationary (NVNG) mobile-satellite service (MSS). The move was contained in the industry's so-called flexible allocation proposal, delivered at the February 13, 1997, meeting of FCC Informal Working Group (IWG) 2A. Little LEO targets now include 146 to 148, 219 to 225 and 430 to 450 MHz. The ARRL and AMSAT were among those objecting to the concept, and the League is urging those who agree with their position to comment to the FCC by March 4. IWG-2A has been preparing draft proposals for the 1997 World Radiocommunication Conference (WRC-97). These will be

reviewed during a March 5 meeting of the FCC's WRC- 97 Industry Advisory Committee that is preparing draft proposals for consideration by the United States as it gets ready for WRC-97

The ARRL and AMSAT statement said the latest proposal affecting amateur allocations in the 219 to 225 MHz segment came at the last possible moment and without any technical support whatsoever. The League and AMSAT pointed out that the little LEO proponents have had more than a year to complete a technical study of the possibilities of sharing with the amateur services in the 144 to 148 MHz and 420 to 450 MHz bands. They have not demonstrated compatibility for sharing these amateur bands but over the evolution of their document have proposed various new ideas for use of these bands.

The little LEO flexible allocation strategy for WRC-97--submitted as IWG-2A/86 (Rev. 6)--is to propose broad allocations. The apparent theory is that most administrations would find reasons to oppose little LEO use of specific bands in the crowded spectrum below 1 GHz, but that a broad allocation would permit different implementations in different countries depending on local circumstances.

At the February 13 meeting, a coalition of spectrum interests--including land mobile, amateur, broadcasting, and military--opposed the flexible allocation concept on three grounds: that the concept is simply an invention to avoid performing technical sharing studies that would demonstrate the unfeasibility of sharing; that it is inconsistent with decades of ITU allocations practices; and that, if adopted, the concept would be counter to US interests. The coalition document is identified as IWG-2A/107.

The ARRL and AMSAT submitted a further statement of opposition, citing the absence of any technical studies that might support sharing with the amateur service or the amateur-satellite service and pointing out that the little LEOs have completely mischaracterized the nature of ITU Resolution 640 regarding the use of certain amateur bands in the event of natural disasters. The ARRL/AMSAT paper, revised to reflect opposition to the late proposal to include 219-225 MHz, is identified as IWG-2A/108 (Rev. 1).

Amateurs also might find interesting the comments of the Department of Defense, identified as IWG-2A/101 (Rev. 1). These address the 430 to 450 MHz segment the Little LEOs seek to share.

Anyone wishing to register support for the ARRL/AMSAT submission should send a brief e-mail message to wrc97@fcc.gov. The subject line should say Reference No. ISP-96-005 IWG-2A. A simple statement to this effect, I support the ARRL/AMSAT opposition to the NVNG MSS flexible allocation proposal, will be included in the public record and will help to drive home the point that there is broad-based opposition to poorly conceived sharing proposals.

PLEASE NOTE! The proposals the League opposes are not FCC proposals, nor are they endorsed by any other branch of the government. They are industry proposals. The League's objective is to demonstrate there is broad citizen opposition to the industry proposals, so the government will not adopt them as US proposals. So, please don't flame the FCC if you comment.

Copies of the relevant IWG-2A documents, including the Little LEOs proposal and the ARRL/AMSAT response, are [*]available for download.

Additional arguments or evidence also are welcome. Important! Comments should reach the FCC no later than March 4, 1997!

It Seems To Us, February 1997 QST

MORE ON LITTLE LEOS

Commercial low-earth-orbit satellites operating below 1 GHz, so-called "little LEOs," have been the subject of discussion on this page twice before, in July and September 1996. This is greater attention than they have been getting in the telecommunications trade press, which is far more interested (and rightly so) in the more-capable LEO systems designed to operate around 1.6 GHz and at higher frequencies.

Our preoccupation with little LEOs stems from the unwillingness of their proponents to take the simple and obvious step of acknowledging that sharing spectrum between little LEOs and the Amateur Service is a bad idea.

This bad idea first surfaced last May 7, at a meeting of an informal working group (IWG-2A) of an FCC industry advisory committee preparing for the 1997 World Radiocommunication Conference (WRC-97). At the meeting, an industry representative seeking additional spectrum for little LEOs put forward a list of "candidate bands" for possible sharing that included the amateur 144-148 and 420-450 MHz bands. To make a long story short, we protested the inclusion of these bands on the grounds that amateurs use the bands for a wide variety of purposes, and sharing with a commercial service would impose unacceptable limitations on our future flexibility to operate in the public interest.

Amateurs reacted strongly to the news that these popular bands were being considered for commercial exploitation. Letters and e-mails flooded the FCC, not only from amateurs themselves but from the agencies who rely on us to meet their public-service communications needs.

Seven months have gone by. How much progress have the little LEOs made in demonstrating that sharing is feasible?

In a word, none. But they haven't given up. They are grasping at straws in an effort to get their camel's nose into our tent. Here is what's been happening.

IWG-2A has continued to meet in Washington about every three weeks. In September, the ARRL submitted a 42-page technical analysis showing why the two services, ours and theirs, were incompatible. To date there has

been no refutation of the information we submitted, nor any alternative analysis by little LEO proponents. There being no basis for a claim that sharing is feasible, no sharing proposal has been included in the preliminary report of IWG-2A that was prepared in November. You can download the report for yourself, and read it if you can handle a WordPerfect file, from [*]http://www.fcc.gov/ ib/wrc97/texts/2awp6.doc.

While the absence of an actual sharing proposal is good news, the report is not entirely satisfactory. After briefly describing a few of the many uses that amateurs make of the 144-148 MHz band, the report states: "The diverse nature of the Amateur Service characteristics makes sharing difficult, but not impossible." We objected to the phrase "but not impossible" when it was drafted because in fact, there has been no demonstration of that; it is simply the unsupported contention of the author of this section of the report.

The report goes on to list several possible sharing techniques and to claim that "The sharing studies between NGSO MSS [non-geostationary mobile-satellite service] uplinks and Amateur Services in the 144- 148 MHz band has [sic] not considered, in detail, the various sharing techniques discussed in the above." We objected to the claim that these sharing techniques had not been considered in detail because in fact, some of them were considered in our sharing study and were shown to be either inadequate or impractical.

The grasped-at straw mentioned earlier surfaces in the report as follows: "In addition, the use of NGSO MSS services to compliment [sic] the Amateur Service during natural disasters, under Resolution 640 of the ITU Radio Regulations, needs further study. It is therefore proposed that this effort be continued."

Resolution 640 was developed at WARC-79 to permit the use of specified bands allocated to the Amateur Service for rapid response in the event of natural disaster, without impinging upon national sovereignty or upon the use of the bands by emergency networks of amateur stations. The resolution speaks only of short-term, temporary use in emergency cases--the type of use that cannot be subject to international plans and notification procedures because time is of the essence -- and only in "the specific geographical areas as defined by the responsible authority of the affected country." In the frequency range of interest to IWG-2A, the resolution applies only to 144-146 MHz; its primary focus is on the high-frequency bands.

Resolution 640 was crafted precisely because certain kinds of communications needs in the event of natural disasters cannot be met efficiently through normal allocations procedures. To suggest that Resolution 640 might provide some future justification for a shared allocation amounts to an attempt to stand the resolution on its head.

In summary, the only study of potential sharing between amateurs and little LEOs that has been conducted in IWG-2A shows that sharing is not possible without unrealistic geographical separations. We believe that

should settle the matter; it serves no purpose to suggest that "this effort be continued."

Even if we win in IWG-2A, we must remain on guard against proposals from other administrations. Also, while the WRC-97 preparatory process is designed to insure that there is a technical justification for any allocations proposal, there could be an attempt to end-run the process. In short, the WRC-97 battle will not be over until the final gavel on November 21. And then there's WRC-99....--David Sumner, K1ZZ

It Seems To Us, September 1996 QST

LITTLE LEOS

On this page in July, we alerted you to a potential threat of commercial encroachment into the two-meter and 70-cm bands by low-earth orbit satellites. Proponents of the non-voice non-geostationary mobile-satellite service ("NVNG MSS" if you like highfalutin abbreviations, "little LEOs" if you prefer cute acronyms) are seeking additional spectrum below 1 GHz in order to expand their service at the 1997 World Radiocommunication Conference (WRC-97). Despite our objections, they have been unwilling to drop the two most popular VHF/UHF amateur bands from consideration as candidates for their service. We suggested that amateurs take the FCC up on its invitation for interested parties to comment at any time on WRC-97 preparations.

Reaction from the amateur community has been swift and eloquent. Literally thousands of comments opposing the introduction of commercial satellites into these bands have poured into the FCC. At this writing it is too early to say whether the little LEO proponents have been persuaded to look elsewhere, but we hope they have gotten the message that we will do whatever it takes to protect our continued use of these important bands.

What are the little LEOs? A good place to start is to describe what they are not. They are not the visionary constellation of 840 satellites proposed by Teledesic, whose most famous backer is Bill Gates. Teledesic's system, which won two 500-MHz-wide allocations in the vicinity of 19 and 29 GHz at WRC-95, is a fixed-satellite service that is intended to bring wideband digital relay service to any spot on the globe. Neither are they "big LEOs," which are much more capable networks of satellites that will be providing mobile-satellite voice and data service on frequencies around 1.6 GHz. Perhaps the best known, but far from the only, big LEO company is Iridium. The Iridium concept, which uses 66 satellites, can be likened to a TDMA cellular system where the cells move, as well as the subscribers. Leading the Iridium team is Motorola, which has shown over the years that it knows a thing or two about communications. Teledesic, Iridium, and the other players in this arena are staking billions of dollars on their ability to find customers and to serve them well enough to make a profit.

Little LEOs are somewhat more modest in concept, if not in their bottom-line projections. Intended to provide slow-speed data, messaging, and position-location services through low-cost ground terminals, they use fewer satellites (typically a couple of dozen per constellation) that could be launched at a cost of "only" a couple of hundred million dollars per system. There are two companies with operating licenses: Orbcomm, which has the first two of 36 planned satellites in orbit, and Starsys, which is expected to launch beginning in 1998. They use the same frequency bands, 148-149.9 MHz for uplink and 137-138 MHz for downlink. Orbcomm uses conventional FSK, and Starsys plans to use spread spectrum; even so, questions have arisen about their ability to share with one another, not to mention with the various terrestrial services that populate these bands. They and other little LEO companies are counting on having millions of customers, who will pay enough to permit them to recoup their investment and more besides.

Sound reasonable? Let's think about this a moment. Even if we discount Teledesic for now as being farther in the future, we're going to have big LEOs coming on line at about the same time as the little LEOs. Where is the competitive advantage of the latter? It's not in the cost of ground station equipment; 1.6-GHz technology is getting less expensive all the time, as anyone knows who has priced a GPS receiver lately. It's not in the cost of the satellites themselves; calculated on the basis of available throughput, the big LEOs are no more expensive than their smaller, less talented brothers. It's not in the messaging cost; once the big LEOs are in operation you know the cost of using them is going to drop to whatever level will keep the systems busy, as it has with cellular and domestic long-distance telephone service.

Estimates of the little LEOs' customer base (of, believe it or not, 51 to 56 million users by the year 2002) assume there are no competing technologies for those customers to use, and are inflated by the inclusion of non-mobile customers (such as remote pipelines) that do not fall within the definition of their radiocommunication service.

Who would invest their money in a little LEO system? Beats us. If you find someone who would, maybe you can sell them the 2400-baud modem that's gathering dust in your junkbox; buying it would make about as much sense. We wish the little LEO companies that already have licenses well, but where does it say that it is in the public interest for the FCC to beat the bushes to find more spectrum for additional companies who simply want the chance to make a buck by doing the same thing?

This much we do know. The two-meter and 70-cm amateur bands are precious public resources. What gives them value is that we amateurs are motivated to equip ourselves to operate in the public interest by virtue of the flexibility of access that we have been accorded. Strip us of that, and you hobble the nation's paramount volunteer communications reserve.

Let this be our challenge and our pledge: To the extent that technology makes it possible to use these bands more intensively, they can and will be used. By amateurs. In the public interest. Now and forever.

-- David Sumner, K1ZZ

Newington, June 6: Amateurs' comments are making an impact! FCC changes procedures to handle deluge. Committee chairman asks ARRL, " end this campaign." ARRL responds, "you have been misinformed, " urges continued member participation.

In just one week, more than 1000 comments from amateurs opposing commercial exploitation of the 2m and 70 cm bands have been received at the FCC! In a [*]June 5 letter to ARRL Executive Vice President David Sumner, K1ZZ, FCC's Cecily Holiday confirmed that "all written and electronic comments received at the Commission to date by Amateur Radio operators have been included as part of the public record on WRC-97 proceedings. However, in the interest of efficiency, we have created a designated FCC office and e-mail site to channel future WRC-97 comments directly to the WRC-97 Committee Chairs."

An FCC Public Notice dated June 6 outlines the new procedures.

Also on June 5, FCC Industry Advisory Committee Chairman Scott Blake Harris wrote to Sumner to object to the ARRL's "tactic." Sumner replied the same day, "As you have been misinformed with respect to the League's activities, I am pleased to have this opportunity to set the record straight." We have honored his specific request "that ARRL ask its members to stop the e-mail/ fax deluge directed at private sector members." However, " we reserve the right to report in the future on the actions of any participant in the WRC-97 preparatory process. Furthermore, we will continue to urge our members to monitor the process closely, and to participate as required to protect the interests of the Amateur and Amateur-Satellite Services." The complete texts of both letters are available on this Web site.

The presses had not yet rolled out page 9 of July QST, so the editorial planned for that issue has been revised to reflect the new FCC procedures.

Check this site often for further developments. NEWINGTON, MAY 29: THE AMERICAN RADIO RELAY LEAGUE IS ASKING RADIO AMATEURS ACROSS THE UNITED STATES TO HELP DEFEAT A THREAT TO THE TWO MOST HEAVILY USED AMATEUR VHF AND UHF BANDS.

An industry working group (known as IWG-2A) that is preparing draft US proposals for the 1997 World Radiocommunication Conference has before it a list of "candidate bands" for low-earth orbit mobile satellites ("little LEOs") that includes, among a number of others suggested for consideration, the 144 and 420 MHz bands. Little LEOs are intended mainly to offer commercial paging and other low-data- rate messaging services. The list of candidate bands was submitted by little LEO industry representatives at a meeting of IWG-2A on May 7. ARRL Technical Relations Manager Paul Rinaldo, W4RI, was present and objected strongly to the inclusion of these two bands. He was told that objections should be submitted in written comments, and the ARRL did so on May 15. At the same time the ARRL advised the industry participants in IWG-2A along

with its chairman, Warren Richards of the Department of State, that if we did not receive assurance that the bands would be dropped from the list of candidate bands we would have no choice but to advise members in July QST that the bands were under threat. No such assurances were forthcoming. Instead, we were told that as long as little LEO allocations requirements remained unsatisfied, everything had to remain on the table.

This response was not acceptable. Accordingly, when July QST went to the printer on Tuesday, May 28, it included the following editorial. The editorial speaks for itself, but it is worth emphasizing that there is no reason for panic. What we are dealing with is an ill- considered industry effort that is in its early stages; there is no reason to believe there is any government support for any move against these two amateur bands. Our mission is to quash the idea before it goes any further. An outpouring of thoughtful comment by amateurs, explaining why the public interest would not be served by the introduction of commercial services into these bands, will go a long way toward ensuring the desired outcome.

The editorial can be reprinted in its entirety with the credit line, "Reprinted with permission from July 1996 QST." You can download and view this column as the Adobe Portable Document Format file [*]2m70cm.pdf (20,418 bytes), also available via FTP at ftp://ftp.arrl.org/pub/qst/2m70cm.pdf . (You'll need Adobe Acrobat 2.1 or higher to view or print this file.) It Seems to Us, July 1996 QST (Revised):

Write Now!

Get out a pen and paper, or boot up your computer. There's work to be done! Your help is needed to DEFEND TWO METERS AND 70 CM. Yes, that's right--the two most popular and most crowded amateur VHF/UHF bands! But don't panic, and don't "go ballistic."

Here's what's happening, and what YOU can do about it.

The United States is preparing for the 1997 ITU World Radiocommunication Conference, WRC-97. In the past, the public has been able to participate in the preparations for such conferences by responding to FCC Notices of Inquiry. In March, the FCC announced a streamlining of its International Bureau's preparatory processes for WRCs. Under the new scheme, the NOIs have been eliminated in favor of increased emphasis on WRC Advisory Committees.

For WRC-97, a series of Informal Working Groups (IWGs) of the Advisory Committee has been created to address specific agenda items. The output of each IWG will go directly to a joint FCC-NTIA-Department of State Steering Committee of the Advisory Committee. There, draft proposals as received from the IWGs will be reviewed and forwarded to the FCC for possible release as preliminary US proposals for public comment.

In announcing the streamlined WRC preparatory process, the FCC tried to reassure those who might be concerned about reduced opportunities for public participation: "Interested parties should note that input to the Advisory Committee may be sent at any time...." A pre-press version of this editorial, circulated far and wide by e-mail and packet radio, caused so much input to be generated--MORE THAN 1,000 COMMENTS in less than a week--that THE FCC HAD TO MODIFY ITS PROCEDURES to cope with the deluge!

Hold that thought while we shift gears to the substance of the issue.

One of the WRC-97 agenda items includes consideration of possible additional frequency allocations for the mobile-satellite service. So-called "little LEOs," low-earth orbit satellites below 1 GHz, already have allocations. Their proponents claim these are inadequate and are trying for more. The needs of little LEOs are being addressed in IWG-2A, chaired by Warren Richards of the Department of State. The ARRL technical relations staff participates in IWG- 2A to represent Amateur Radio interests.

At the May 7 IWG-2A meeting, an industry representative presented a list of "candidate bands" for little LEOs. The list included a number of bands that would negatively impact existing services, and does not include others that would appear to be technically more feasible but to which strong objection from incumbents could be expected- -the point being that some political, rather than purely technical, judgment already has influenced the list. We have asked for, but to date have been given no explanation of why some bands were included and not others.

Incredibly, 144-148 AND 420-450 MHZ WERE INCLUDED ON THE LIST! This is the first time in memory that another service has been proposed for the two-meter amateur band. We must make sure it is also the LAST time.

We do not need to explain to ARRL members the extensive use that is made of these bands by amateurs. The two bands provide the backbone of our local public service communications effort. Voice and data, mobile and fixed, even television--the list of present amateur uses is a long one, and of future uses is even longer. Both are already used for satellite services and for moonbounce and extended-range terrestrial operations requiring extremely sensitive receivers and high levels of effective radiated power.

Apparently we DID need to explain all this to the little LEO industry representatives, so we did just that--both at the meeting and in a followup letter on May 15. We also explained that we had to regard the matter as extremely serious. No one with the slightest background in radiocommunication could possibly believe that a mobile-satellite service could be introduced into either band without disrupting existing and future amateur operations. Therefore, we said, if we did not receive assurance that they would be taken off the list of candidate bands by the deadline for this issue of QST, we would have no choice but to bring the matter to the attention of the entire membership.

The response we received was unsatisfactory. In effect, we were told the little LEO industry would consider our views but that until their spectrum needs are satisfied, all bands must remain under consideration.

So, this is a CALL TO ACTION. We must get across to the industry and government participants in IWG-2A that the 144-148 MHz and 420- 450 MHz bands CANNOT be considered as candidates for mobile-satellite services. We need to drive the point home so forcefully, with so many grassroots responses, that no one is EVER tempted to try this again.

Which brings us back to that invitation for "interested parties" to send input "at any time." THERE'S NO TIME LIKE THE PRESENT! According to the Commission's new procedures, comments by e-mail should be sent to: [*]wrc97@fcc.gov. Written comments, with an original plus one copy, should be sent to: Office of the Secretary, Federal Communications Commission, Washington, D.C. 20554. Each comment should include at the top, "Reference No. ISP-96-005" and " Advisory Committee Informal Working Group 2A." FCC staff assures us that comments will be given prompt consideration, and asks that parties refrain from filing comments in accordance with previous instructions.

DO comment. But be civil. DON'T abuse people who are simply doing their jobs. We have to get across that casting covetous eyes on amateur bands is counterproductive, and contrary to the public interest. To accomplish this we need a LOT of comments, including YOURS. But remember that the objective is to educate and persuade, NOT to intimidate. We don't need to. The facts are on our side.

For the latest news on this particular issue, check the ARRL Home page at http://www.arrl.org/ and click on "Band Threat News." Then write. Right now!--David Sumner, K1ZZ

Thank you for your posting to the newsgroup.

I'm going to presume that you might have meant AT&T as the
"globally-known" company. If so, I'm curious about some testing they were
doing awhile back in
the Charlotte area regarding signal propagation at 1900 MHz.

I'd appreciate any general comments you might offer about what type of
weather
conditions might enhance signals at that frequency, vs. enhanced tropo at
lower
VHF frequencies.

Thank you!

Jeff Multer, Charlotte, NC

2555. Re: NH State Police to beta test digital system

Newsgroup: rec.radio.scanner
Date: 1997-02-19 00:00:00 UTC
From: jeffmulter@aol.com
Message-ID: <19970219203800.PAA05106@ladder02.news.aol.com>
Source record: 206735

New Hampshire has been testing a digital system for its State Police for several years, with mixed results, according to the reports I've read.

Considering the financial problems for both Baltimore and Orange County, Ca., it's probably not likely either will adopted Project 25 compatible radio systems in this century.

Maybe someone might comment on the State of Michigan, which I believe is currently moving its State Police from low band to 800 MHz in some districts (Monitor America refers to it as a "digital trunked" system).

Jeff Multer, Charlotte, NC

Bruce,

If all the above don't work, you MAY try a Factory Commercial Radio such as a Spectra, ect. just like they use. Sensitivity is much better and they are built to rec. that band.. :)

2559. A question to owners of the ICOM R-10

Newsgroup: rec.radio.scanner
Date: 1997-02-19 00:00:00 UTC
From: Markus Buttinger <markus-b@ping.at>
Message-ID: <330B6E86.2AFD@ping.at>
Source record: 206739

hello owners of ICOM's R-10,

I just got my R-10 yesterday and I
have a problem with it: The function
'SET SKIP' does not seem to work:

When entering a frequency in a memory
location, 'EDIT' changes options for
that particular memory location (like
name tag, mode, and a function called
'SET SKIP ON/OFF', meaning that during
a scan this channel is being skipped.

Even if I set this to ON, the radio
stops on that location during a scan!

Q: Am I too stupid to understand the
manual or has someone else experienced
that problem? (the dealer I bought it
from is polite but dull... :)

please reply to my private e-mail address
rather than to the list. Thank you!

Markus.

>How about voltage? What value resistors have you used with the
>discriminator output of the 2006 (TP2) with good luck?

You may not be on the correct frequency. For example PD203 won't decode FLEX paging signals. MDTSTUFF only decodes MDC4800. Other signals may sound similar, but not be the same.

As for the circuit, remove the 100k and 10k resistors in the feedback circuit, and tie the (+) input directly to ground. Also be sure the power supply capacitors are as close to the opamp as possible.

My problem is not my decoder , but the fact that I have very few MDC4800 transmissions around. Reading appliance repair messages gets very boring, real fast.

Let me know what happens.

Hi John:

I attended the recent Skywarn class put on by NOAA and the
Raleigh Amateur Radio Society this month. After the meeting,
I asked about the SAME compatable receivers. What I was told
is that there are a very few commercial units out there for
radio/TV station use. The price I seem to remember hearing
was about $500.

I would be very surprised if Midland and Radio Shack didn't
have a unit under development right now.

: --Barney Wilborg--
: Owner, Borealis Communications

As someone who has SUCESSFULLY did a MARS mod on a W2A, which has the
same tiny diodes you speak of, it's NOT that of a big deal, unless you
are either uncoordinated, or a fool.
SMD tools are NOT needed.
This is made even simpler by the fact that ICOM does not glue the SMD's down.
A cheap 15 watt grounded tip soldering iron from Radio Shack is perfectly
adequate(you might want to narrow the tip just a BIT).
BTW, all of my tech knowledge is self-taught, so I have NO professional
SMD experience.
I've also assembled a postage stamp sized SMD FM transmitter(although the
parts WERE larger than the stuff in the W2A).

[...]

I tested an ICOM IC-R10 and returned it so I no longer have it
in front of me. If I recall, you must select "Skip" scan
in order for the individual channels you programmed with the
skip bit to be skipped.

The same is true for other ICOM models like the R8500, R7100, etc.

The skip terminology is so concise it's confusing.

The word "skip" not only refers to a bit you can set for each memory
channel, but it is also a global flag you can enable or disable
that determines how the scan works.

If you don't enable the global skip flag, the firmware scans
memory channels regardless of whether their individual skip
bit is set.

Having heard enough rumblings from the direction of the
Capital, I decided that we need a centralized discussion area
for any legal action we wish to take regarding scanning.

So, I created this list (and it's digested counterpart).

To subscribe to this list, send a message like this:
To: scan-legal-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: scan-legal-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

Digests go out once a week, Monday mornings.

Tell your friends and spread the word!

Items open for discussion are things like how we can educate
our legislators and the media.

I have the safety 1st baby monitor, and I was wondering, is there any way to modify it, so that I can get more output range on the transmitter? I am not worried about eaves droppers, as I am WAAAAAAAY out, and I need a was to monitor the baby while he sleeps, about 50 yds or so away, in my computer room, it barely makes it that far now, lots of static, so i guess i need to "tune up" the transmitter.

Thanks for your help.

This is consistent with the manual. If you don't enable global skip
then marked channels are not skipped.

Darrell, you obviously haven't been reading the MDT posts lately.

First of all, Motorola MDT's are not ENCRYPTED (which is the restriction placed on Munitions). They use 20 or 30 year old encoding schemes. Encoding, or scrambling, is used to increase the reliability of the reception, not for security.

Over the last year, several companies (including L0pht) have started selling interfaces that will enable you to decode digital pagers, and now MDT, and Trunking control signals.

Thirdly, the source code for much of the above has been circulating for months.

Several people are also distributing programs that run on your sound card.

H Higgins

P.S I just saw info on the EDACS protocol postedtoday. It probably won't be much longer for that too.

Why is it that _everyone_ these days seems to be wanting to
charge money for some advice I am willing to give everyone who reads
this message FOR FREE! It's simple for anyone with _any_ scanner to
monitor cellular telephone calls. Here's how.

The simplest method, purchase an older scanner that scans the
800 to 900Mhz block. The FCC "asked" manufacturers to discontinue
producing such units when cellular became popular, and listening to
phone calls started to become "a problem". These scanners are getting
rare and hard to find. People who have them, know what they are, and
know what they're worth. Another method is to purchase a scanner that
has been modified by a technician to receive cellular. These modified
scanners are available at every ham-fest or swapmeet that I've ever been
to. Usually there are a few guys sitting at tables that will mod a
radio you bring to them for a price. However, they can only modify
certain scanners, and you can't guarantee that they will always be there.

Now for the most applicable method of all. This method allows
anyone using ANY BRAND of scanner that tunes 400-500Mhz (it ain't a
scanner unless it does, so this includes about _all_ models) to listen
to cellular phone calls. This method involves using what is called, a
DOWN CONVERTER.

Ramsey Electronics (http://www.ramseyelectronics.com) as well
as many other electronics specialty and ham/hobby kit dealers sell such
devices. They are simple heterodyne converters that receive all signals
in the 800-900Mhz band and convert it to half that frequency, or
400-500Mhz. You simply connect your external antenna to the down

converter, and connect the down converter's output to your scanners antenna input, turn it on, and start listening. By the way, tho I do like Ramsey products, I do not specifically endorse them, nor do I work for them, nor have I gained any monetary reward for promoting them. The item that you are looking for is called a "down converter" and it works by "changing the scanner frequency to a lower in-band frequency". You can give these words to any electronics dealer and they can point you to the proper device, whomever they happen to stock.....sq

(there, I just pooped on another Usenet profiteer, PLUS, I saved people $15 each for simple knowledge that _should_ be shared for free. Long live FREEDOM OF INFORMATION, and long live the USENET! Have fun!)

To follow up on this, I searched for and found the direct URL
to the device you will want.

http://www.ramseyelectronics.com/prod05.htm

Most people will want item #SCN-1WT - Scanner Converter Kit,
wired & tested, $89.95

Don't forget to purchase a power adaptor for it. :) Have fun
listening to cellular phone traffic, and remember, you got the info for
FREE from the Usenet, not for $$$ from some newbie who doesn't know that
the Usenet is for the free exchange of information and ideas, and that
commercial use of the Internet or the Usenet is still taboo.....sq

(taboo to us old-timers, as it is no longer expressly forbidden......)

Modification such as you want is illegal. Your best solution is a
wired intercom arrangement. That'll easily go the distance, although
you'll need a pair of wires that run from the baby's room to
your computer room.

Perhaps you don't get the concept because it's a Canadian concept. The
post came from a .ca address and refered to the police being on 140 MHz.

In Canada it is not illegal to monitor cellular telephones (AFAIK).

Regards.

Although this is a wild guess, maybe in the WIN.INI file the 1st line
could be modified to allow it? (I have NOT done the freeband mod, so I
can't tell you if it works).

[FT-50 Programmer]
AllowAnyFrequency=0
Calibrate=5636
Com=2
TemplateFile=C:\YAESU\FT50\MYTEMP1.TPL
UseTemplate=1
DataDir=C:\YAESU\FT50

Maybe changing AllowAnyFrequency=0 to =1 will do the trick? Just a
thought..... Good Luck!!!

You know, when I first got off CB, about 20 years ago, I used to do
that, too. Then, after I made a few friends on the ham bands, and
discovered just how varied and complex amateur radio really was, and
how many unique challenges it offers, I sort of outgrew the "freeband"
stuff. Most of it was/is just as shallow as the worst of ham radio.

So why don't you get a bunch of those outlaws licensed, and move up
onto ten meters for your fun?

> Jon

Jon,
I did not misquote you. Looking back at the archives at DejaNews, you
were correctly quoted by Bob Schwerdtman whose append, in turn, was
correctly quoted by me. I did not edit your, or anyone else's comments.
My original objection was to summitrt@aol.com who felt it necessary
to belittle someone for listening to drive-thru frequencies. Looking
at his/her append you can tell he/she does not understand all that goes
on these frequencies...they seem to think there is only talking to
people who order food...nothing about personal communications to other
workers. Like too many other appends on USENET, it's somebody trying to
put someone else down in hopes it will gain them some sort of respect
for telling everyone else what it is, when all they are doing, in fact,
is proclaiming their ignorance.
As if that wasn't bad enough, you come along and add your "Hear
hear!"
comment, which was correctly quoted by Bob and myself, which seems to
support summitrt@aol.com's original position. Your correctly quoted
comments also state "One would have to be pretty damned bored..."
inferring
anyone who does this is wasting their time. YOU DID NOT SAY that you
only you found this objectionable...you imply that ANYONE who does so
has nothing better to do. I can only guess that, after seeing replies
to your append, you realized your comment was in bad taste or in haste
because you had to "retract" your original statement :

Okay guys! I take back the "brain dead" remarks already. I promise to
give
fast food monitoring another shot one of these first years.

Happy scanning,

Jon

I know all to well that the written word is too easily misconstrued.
And
I was willing to let bygones be bygones. But I pride myself on being
fair
and honest. I did not take your comments out of context, nor did I edit
them to support my argument thereby misquoting you as you claimed I did.
I
do not mean to "lecture" and I was not trying to place any blame on you
and only you. I was simply trying to point out that everyone deserves a
fair share. And we certainly don't need individuals who shoot off at
the mouth via the keyboard, so to speak, as the original poster for this
thread appeared to be doing.
For everyone's personal edification, I have attached the original
USENET postings to this note in the hopes there will be no more
confusion
as to who said what. And for the record, I applaud your efforts for the
support of this hobby, Jon. And you have probably been at this longer,
and
have much more experience than I.

Strong signals to all,
Rich N2MCA

Hear hear! One would have to be pretty damn bored (or brain dead) to
listen these guaranteed yawners.

A person could say the same about many types of monitoring. Who could
get excited about planes taking off? How about a railroad switching
yard? WOW! talk about dull!! Or a school bus (yawn) I thought The Idea
behind the hobby is to listen to communications. I listen to all of the
above and many other types because you never know what you are going to
find. I work next door to a Mcdonalds and tuning in their drive through
window has provided hours of very interesting conversations ranging from
the simple comments made about customers to employees having sex in the
bathrooms. Maybe you Just don't listen long enough. I think that this
newsgroup should be a sounding board for ANY type of scanning question
or comment and not just the ones that suit you.

Just a "Brain Dead" person enjoying some exciting fast food monitoring

Thank you for this commentary. It is not up to one or two individuals
to decide what is and isn't appropriate for the rest of us to listen
to. It is purely a personal choice and may even be the reason for
having started this hobby. A hobby that, these days, needs as many
supporters as it can find seeing as how there are a growing number of
people in our society and Congress who deem it necessary to
collectively label us as misfits or borderline-criminals.

Strong signals,

Just got my new RS Pro26 and realized I have WAY too many radios. I
have to set a limit somewhere, so I'm selling #6...

BC230XLT - purchased 1.5 years ago from Scannerworld.
Mint condition - both batteries with charger, duckie.
It's been a living room radio for when the TV got boring.
No box, no mods, no manual.

Make offer.
Lots of references

Scrambled signals are NOT illegal in the commercial, cellular, business, and Public Safety bands. They ARE illegal in Amateur Radio (Ham) bands.

For example, the FCC regs for the business band states that you must ID in the clear before the conversation goes scrambled, then ID in the clear AFTER the scrambled transmission is completed. However, I have yet to hear anyone actually do it this way!

Isn't this a planned upgrade of the system ? ...NH was the first
beta site for Astro(tm) when Moto was originally testing/debugging
the technology. NH volunteered for the project back then. This new
upgrade reflects 'mature' technology I would think. Since most of
the existing backbone is probably in place...

Does anyone have any experience using this 2 meter? I just bought one and I want to know what is the range of frequencies that I can program without getting any mods on the receive side. the manual says 144-148mhz, 440-450mhz why such a small band? The guy at the store got It to go to at least 470mhz but I cant figure out how. The frequencies I want to monitor are mostly police, fire and weather 144-850mhz would keep me happy on Rx. Am I just stupid and not using the keyboard correctly? Anyone with experience please help! I'm a beginner at this so don't rip on me too bad......

Call Uniden at 800-227-1023 and ask them for a book. I could
tell you how to do it. You essentially search for freqs with calls
on them, then program them into the 350 program slots you have
on that radio.

From: m26@juno.com
Message-ID: <5ef0b7$4d5@news.pc.centuryinter.net>
Source record: 206794

Those frequencies are mostly television channels. Many
of the earliest wireless mikes used ordinary TV audio
channels in the VHF high band. There are never any
more than four of them used (and only in LA & NY) so
you could always switch to one of those not used, though
that could interfere with cable. The bandwidth you are
talking about is roughly channels 7 thru 14 in the vhf television
band which is sometimes shared with wireless mikes. My
scanner will pick up those freqs, but also the audio from
TV. A wireless mike is simply a small radio transmitter shaped
like a microphone that can be picked up by an FM receiver,
tuned to the radio's frequency.

Uhhhh.. folks, you can even conduct business over amateur radio as long as you don't stand to gain DIRECTLY by it. Remember the FCC ruling that allows you to order a pizza on an autopatch? If that isn't business, then I think I'm gonna claim all my pizza orders on my 1040 as charitable contributions. :)

Hello all,

They're finally approved by the FCC and released for domestic sale,
and we've got them boxed and ready to ship to you.

ICOM R10 Handheld receiver. Price $489 + UPS

Comes with nicads and wall charger.

Unblocked or cellular blocked same price. Unblocked to government or
legitimate users only (CFR 2512).

Note that the R10 is a professional communications receiver. It is NOT
intended to be a hobby scanner.

We can take your check over the phone and ship immediately (similar to
credit cards).

247 units sold, 20 left as of Tuesday evening. Get yours now, once
this lot is gone you will have to wait for resupply.

Call 0900 - 1700 EST weekdays only.

For Sale: Optoelectronics Xplorer - $700 firm

Looks like new, used about 5 times for a project that ended. Comes with box
and everything (cable, manual, charger, etc). Not a scratch, it's 100%,
except $200 less than new. Opto recently had a modification/upgrade for
the Xplorer and it has been performed and re-calibrated by Opto.

Sorry, no trades at this time. I'm in Northern California (SF Bay Area)
and would prefer COD shipment if you aren't nearby.

Drop me a note if interested.

Just to clarify ... my 900 Mhz digital cordless is NOT spread spectrum.
According to what I've read on usenet, plain digital is also secure
since digital scanners are not available in the US. Spread Spectrum
suppossedly adds an additional layer of security.

You send a few dollars to one of the people selling "Registered scanner"
certificates and then when you talk to the authorities or the media you call
yourself a Registered Scanner. Since most people know next to nothing about
scanning some of them are sutiably impressed. It's like the phony law officer
ID cards and badges - means nothing but impresses the ignorant.

IIRC Popular Electronics used to run a Registered Short Wave Listener deal
many years ago. You got a certificate with a registration which looked like a
callsign and was very impressive hanging on the wall.

>WB7DOW @ KB7CFD.ID.USA.NOAM

Glen,

That's exactly what we do! I have helped a dozen or so cb'ers get their ham licenses, we get on 10 meters and have lots of fun yacking. We also "slither" down to CB and keep working on the guys that are good sideband operators, trying to get them interested in an alternative to being stuck with the idiots who otherwise populate the 11 meter band. We have been known to meet in the middle, the so-called freeband, this gives 'em a taste of what's in store on 10 meters and beyond.

It seems like guys who came up from a varied past (CB, etc) are much more interesting people to talk to than your average 2 meter techno-tards. I got my General in 1977, and was a CB'er since 1970, so I know where you're thinking comes from.

I could care less about smug and arrogant hams looking down on people like myself who would do something to inject some life into a half-dead hobby. I'll match credentials with the best of 'em. The big difference here is that I'm honest. I know lots of hams who freeband regularly, yet would never admit it openly to anyone but a select few people they trust.

My 2 cents worth.

Happy hamming,

Jon, KF7YN

Well in my opinion the ones that Radio Shack sells are pretty decent, I bought the cheap model (20-176) and greatly improved my reception. I would assume that the better antenna that you buy the better reception you will get. I have had mine for about a year now, and im pretty happy with it.

From: "Randy B." <RandyB@DNC.Net>
Message-ID: <330B2833.46FD@DNC.Net>
Source record: 206820

Greetings,

I'm considering buying a Pro-2006 scanner from a friend of mine. If I do, I'm interested in installing the Optoelectronics interface board. I have a couple of questions first.

1) What is involved in installing the interface card? I'm a tech with HP, so the electronics work isn't a problem. I just want to know what the wiring entails.

2) What software is recommended? I have a 133MHz Pentium computer with plenty of memory, etc. I'd like to be able to decode DTMF and other standard radio signals.

I intend to use this radio with an external antenna to improve reception and to reduce the possibility of computer interference through the RF input.

I would appreciate comments from anyone who has this configuration and can advise me on it's pros and cons.

You are correct Joe, but I'd consider ordering a pizza not to be
falling under *my* definition of "conducting business." IMO, ordering
a pizza for personal consumption, is not "conducting business" WRT
me. If the Pizza Parlor however, were to take orders via Ham radio,
then that would be.

I remember ordering water to go with my Big Mac once. It happened to be raining really hard. The clerk suggested I just hold a cup out the window. When I got to the pay window I asked her why she was so rude. With an innocent look on her face, she acted like she didn't know what I was talking about. I then told her what I heard her say on my radio. She slapped her hand to her mouth and gasped. She was a good girl after that (at least as far as I could hear her).

2647. NH State Police to beta test digital system

Newsgroup: rec.radio.scanner
Date: 1997-02-19 00:00:00 UTC
From: Jon Van Allen <yonnie@worldnet.att.net>
Message-ID: <5edn5u$31g@mtinsc04.worldnet.att.net>
Source record: 206857

Hot off the press from The Electron: New Hampshire State Police will be the first to beta test Motorola's (Project 25) radio system, which consists of 350 Motorola Astro Spectra mobiles, 275 of Motorola's newest portable radio (the XTS 3000), and 13 Centracom Gold Series Elite consoles.

According to Richard M. Flynn, commissioner of the NH Department of Public Safety, the system's extensive infrastructure will be capable of providing two-way voice and mobile data communications to every state agency and department that chooses to join the system.

This capability is called interoperability, and it is a Project 25 requirement, according to Motorola.

The system will be installed now through the end of 1997, and will serve the state police as well as other law enforcement and governmental agencies and departments throughout NH.

Other areas of the country either planning to go digital, or studying it, are: Michigan, Baltimore and Orange County, CA.

Scan the NH State Police while you can folks until a digital scanner is available.

Happy scanning,

Jon, KF7YN

I agree that some of the people that work at Radio Shack are uninformed but we should, as conscience radio phobes,
enlighten them not barate them! I do not work nor have I ever worked for Radio Shack but imagine working at a place
where all the customers think you are an idiot. I mean for the most part these workers are right out of high school. If you
try to enlighten them and they cop an attitude then , if you must, barate them but first try to educate them.

You can add a whip on top of the Rad Shack discone to improve the low band if you like just remofe the rubber cap and you will find a threaded area that a standard cb whip will thread into. It greatly improved the low band on mine. good luck.

DAL> I doubt it! A MDT decoder would be illegal to sell under the ECPA. The
DAL> act not only covers cell phone, but also digitally encoded data.

As has been proven conclusively here recently, the Motorola MDTs are NOT encrypted. And now that the decoding data is 'widely available', there can be no case made that it falls under the ECPA.

... Your project will be late.

2655. Ok any mods BC220/Pro 50

Newsgroup: rec.radio.scanner

What's the deal with Jacksonville S/O ??
I noticed that they have been using letter designations
with their user numbers. i.e Foxtrot 55 etc...
Something new ??

this is what I have for Jacksonville s/o frequencies:
If its out of date let me know so I can listen in...

453.1500 Channel #01 Zone 1 North (Mike / November)
453.1000 Channel #02 Zone 2 Westside (Juliet / Kilo)
453.0500 Channel #03 Zone 3 Downtown
453.4500 Channel #04 Zone 4 Northside
453.4000 Channel #05 Car / Car
453.2000 Channel #06 Investigators
453.3000 Channel #07 Info / NCIC
453.3500 Channel #08
453.2500 Channel #09 Admin / Phone Patch
453.6000 Channel #10 Car / Car
453.3250 Channel #11 Vice
453.5500 Channel #12 Detectives
453.9500 Channel #13 Zone 5 ??

Fill me in here....

Mike

Incrementalism. The Domino theory. A Slippery Slope. They're all
names for the same thing. Once it's illegal to listen to one set of
frequencies, or one radio service, it becomes much easier for the Powers
That Be to make it illegal to listen to more frequencies or more radio
services. Like the police and the railroads, or anything else except
the AM and FM broadcast bands. That's no fun, as we all know.

Mark,

My 900Mhz digital phone sounds better than my wired phones and light years better than my old AT&T 46Mhz cordless.

Don't know what to tell you, maybe your phone lines are old or power line needs noise filter or conditioning.

I'd compare the phones in a different place like a friend's house.

Good luck,

Jon

Think about this, I would think most HAMS would realize the problem is probably not the transmitter but the reciever, and the interference caused by most computers. What is the signal with the computer off? I pick up baby monitors all over the neighborhood with my 6 meter beam antenna and Polytronics receiver. You can tune up the receiver without breaking any laws. Adding an outside antenna is perfectly legal on the receiver, and would probably be the best solution.

I guess in this appliance operator world the answer is always increase the power, get a bigger amplifier, a more powerful radio, not try to solve the real problem, interference, and poor sensitivity of receivers.

me@not.here.com said the following:
>I've noticed a clicking sound in the ring when I'm calling someone. The
>clicking sound goes away after a connection is made. Is this normal for
>900 Mhz digital phones?

No, but it's a normal artifact of VTECH phones. Many more or less solid tones
will cause it; for example I found simply breaking dial tone and singing a
"laaaaaaa..." into the phone demonstrates it quite well.

>Is it possible to extend the range of the 900 Mhz digital phones? My
>base unit is currently installed on the first floor (of a two story
>house) in the middle of the house. Would moving it to second floor help
>noticably? Is higher generally better? I get the impression that the
>length of the antenna isn't that important for 900 Mhz phones since the

>length. Does anyone have any experience with external antennas? I saw
>an external antenna for $60 in a 'Hello Direct' catalog designed to
>improve range but they don't really say how much it will improve range.
>What about an antenna on the roof?

Higher's better, a roof antenna also works, but if you want range you'd likely
be better off investing in a higher range phone like the Escort 9701 or the
Lucent 9510.

>When doing range testing I noticed that at the limit of the phone's
>range sometimes only one side of the transmission gets through. In
>other words, the base unit can hear the person on the handset but the
>person on the handset can't hear the person at the base unit or vice
>versa. Why does this occur? Is it because two channels are in use?
>Another thing I've noticed is that if the handset is out of range,
>pressing the intercom button on the base unit to signal the handset will
>sometimes cause the handset to ring but the handset can't establish a
>voice connection.

Depends on the type of phone. For the VTECH, they treat transmissions like an
analog cordless phone and use one frequency for transmit and one for receive
and just digitally encode the transmission first. Spread spectrum and frequency
hopping phones do things differently but can still occasionally have problems,
and as such receive and transmit "dropouts" can occur on phones using those
technologies, it's just won't be a "permanent" situation like it would be
on the VTECH until you changed "channels."

==========
New to the Radio Shack line of scanners is the Pro-2045. This
base/mobile unit offered an intriguing combination of features and
frequency coverage that I found hard, alright impossible, to resist.
I placed my order and waited impatiently for it to arrive(as anyone
does for a new toy)! After spending some "quality" time with it, I
thought I'd offer up a few words about it.
What follows are my personal impressions regarding the features
and performance of this scanner. This, in no way, should be viewed
as an endorsement to purchase this radio. I have no personal or
business relations with either Tandy or Uniden Corporations.
These are simply thoughts offered to my fellow hobbyists who may
be interested in purchasing this particular radio.

What you get : Pro-2045, antenna, AC adapter and instruction manual

Model tested
Serial # : 65007677
Dated : 3A6(March 1996)

Basic specs :
Channels : 200
Banks : 10
Coverage : 29-54, 108-174, 216-512, 806-1000(minus cellular)
Scan : 50 channels/second
Search : 100/300 freqs/second
Steps : 5 & 12.5kHz
Modes : FM & AM
Sensitivity : 0.5 - 0.8uv FM, 1.5uv AM

Conversion : Triple
IFs : 1=380.7MHz 2=10.85MHz 3=450kHz
Priority : 10 channels
Search skip : 50 frequencies
S-meter : No
Delay : Programmable 2 second
Lockout : Per channel
Attenuator : Per channel & search
Lock : Tuner
Tone codes : CTCSS optional
Rotary control : Yes
Channel count : Yes
Data skip : Yes
Weather : Pre-programmed
Weather Alert : Yes
Light : Display
Power : 120V AC
Audio : 1W
Memory : volatile; 3 day backup

Construction and Physical
For starters, this radio is EXTERMELY light. You are very tempted to think that you are holding an empty box. The manual specs the weight as 1lb 17oz...anyone else confused by that? It does spec 960g which would be a little over 2 lbs. Compare that to the Pro-2037(2.5 lbs) the BC9000XLT(4), Pro-2042(4.4) and Pro-2006(4.8).
The case is entirely black plastic. It is similar in size to the Pro-2006 making it quite compact and more "manageable" than the Pro-2042 or BC9000XLT. Especially if you are going to use it mobile.
The front panel contains the volume and squelch controls, and earphone jack along the left hand side. To the immediate right are two rows of 12 control buttons. Next up is the display along the top with three rows of 17 control buttons just below it. Just to the right of the display are seven more buttons with the rotary control below them. That's right...a rotary control...which is becoming more prevalent on today's models much to everyone's satisfaction. The rotary control contains a dimple to aid in "speed" tuning.
And in the very bottom right-hand corner, in small lettering, is the Pro-2045 moniker.
On the bottom, near the front, are two fold-down feet with rubber grips. They can be left up which affords about a half inch of elevation, or can be folded down giving an additional 3/4 inch elevation. Near the rear of the unit are two additional rubber feet which give about a 1/8 inch clearance.
The top of the radio contains a black plastic grill toward the rear for the internal speaker. The grill measures approximately three by siz inches. The manual specs the speaker as 2 7/16 inches(57mm).
The back of the unit holds the BNC antenna connector, information sticker, manufacturing date code sticker and AC adapter jack. Notice that this unit uses an AC adapter just like the BC9000XLT. It is

very easy to unplug this radio to take it mobile if you should so desire. You'll just need to get a DC adapter(like No. 270-1533) to power it from your cigarette lighter. The antenna supplied is one that most Uniden owners will recognize immediately. It's a black plastic push-on BNC connector with a metal right-angle adapter connecting it to a 4-element telescoping whip terminated in a black plastic cap. Anybody else starting to get the feeling that this model, like many others, just might be made by Uniden for Radio Shack?

Features
Let's start with one of the most useful features this radio has; the rotary control. This can be used to scroll through the programmed memory contents and, more importantly, to change the frequency being displayed. You can use it directly off of a memory channel frequency, or when you have stopped on a frequency during search mode. This control can also be locked to prevent accidental activation. There is a dedicated key, just like the BC9000XLT, which determines which mode the control is in... frequency, channel or lock.
The display is quite a large LCD containing indicators for frequency, channel, banks, and the various modes which are too numerous to list here. The display contrast is very crisp and pleasing. The backlight is on constantly and provides a nice, even, orange illumination. I find this display more aesthetically pleasing than the dot-matrix characters used in the BC9000XLT. The display is very readable from most angles except from above so don't plan to put it on a shelf above eye-level if you care to read it!
All of the keys and controls are black plastic with white lettering. The keys are well sized and spaced. One disappointment here is that the volume and squelch have no "stripe" marking on them. They do have a pointer ridge but the black color does not help to make them evident. Another setback is the fact that the numeric keypad is not a standard format. Having the decimal point and 0 keys along the right hand edge, rather than the bottom, is a large annoyance to this user. All keys do have good tactile feedback though.
The audio on this unit has plenty of power with a good sounding tonal quality. If anything, it might have a little too much treble. But after to listening to the BC9000XLT, I prefer the 2045 because it has much better mid-range making the voices sound more natural. Usable volume before distortion sets in is about 90%. However, above 75% there is too much background "hiss" heard making it uncomfortable to listen to.
Speaking of audio, let's talk about the keyboard beep on this radio. It's much too loud! By about a factor of three. It is also independent of the volume setting unlike the BC9000XLT. Luckily, the manaul tells you how to disable this annoyance.
Like most Radio Shack models, each programmed memory channel can be locked out so that it will be skipped during scanning and a 2-second delay can be added. Additionally, the 2045 allows each channel an attenuator setting.
Another feature that some find useful is the channel counter. With every memory channel, there is associated with it a counter. This counter

is used to indicate the number of times that channel has had activity. Every time a the radio opens the squelch for a memory channel frequency, it bumps the counter by one. When the unit is powered on, all counters are set to zero. There is also a way to reset the counter manually. The counter maxes out at 99 and will not increment, interestingly, if the channel is locked out. If you just "sit" on one channel and are displaying the count for that channel, every time you get a transmission the counter increments; as long as it is not locked out.
The earphone jack provides a monaural signal to a set of headphones or earphone. Using an earphone, there was no noise or clicking heard while scanning or searching.
The priority, CTCSS and weather alert features are described below in their own sections.

Programming
Programming of this radio is no different than any of the other Radio Shack models. Find the channel you want to program by scrolling through memory using the rotary control or by directly inputting the channel number. Press PROG to enter programming mode and then type in your frequency. You can also decide whether you want to turn on delay, lockout or the attenuator for this channel. You can even program one channel per bank as the priority channel(see Priority section for details).
The radio will automatically round the frequency to its "proper" value if need be to conform to the step size assigned to the band within which the frequency resides. It will also automatically select AM or FM mode which can be overriden using the MODE key.
To erase the contents of a partcular channel, a value of 0 is programmed. The radio will automatically lockout that channel(the lockout indicator comes on) and it is not possible for you to turn it off. I am sure this made Mr. Parnass happy to no end!

Scanning
Once you have your frequencies programmed in it's time to scan for activity! Simply press the SCAN button and watch it go. Banks are selected and unselected for scanning by pressing the appropriate bank number key.
To speed up the scanning program, the 2045 can be configured to scan the channels within a bank by increasing frequency rather than by increasing channel number(the default). When auto sort has been enabled, the AUTO indicator lights while the 2045 scans.
This radio also has the data skip feature which they claim will skip over non-modulated or data frequencies(pager or trunked). It works well on non-modulated carriers and does an a pretty good job for paging signals. However, it has a tough time with trunked data channels as would be expected. Once encountered, it takes about 2 seconds of steady tone for the radio to detect some "constancy" and move on. The manual notes that this feature does not work for AM mode.
There is also a feature allowing you to review all the locked out channels in all banks. Similar to Uniden models, there are functions that allow you to move a channel frequency to another channel or two

swap the contents of two channels.
Scanning speed is very fast but does not quite live up to the 100 channels/second claimed in the specifications. With auto-sort on it's around 70-80 channels/second and drops to 60-70 when off if you have a mix of wide ranging frequencies.
One comment here with regard to scanning a mix of of VHF and UHF frequencies. I was experimenting with a bank of VHF commercial and UHF military aeronautical frequencies and noticed a faint clicking sound coming from the speaker while scanning. Locking out either all the VHF or UHF frequencies removed this clicking sound. It's not intrusive but you will notice it if you have little or no background noise while you are scanning. We're obviuosly getting some switching noise bleeding into the audio circuitry.

Searching
There are three search types available using this radio : limit, direct and auto. Limit search allows you to search between two programmable edges. Direct search allows for searching up or down from a reference frequency. Auto search is a limit search that stores any active frequencies found in banks you designate.
During any search, you can override the automatic AM/FM mode, use delay to pause for a response after a transmission ends and the attenuator if you have problems with intermodulation in the region you are searching. Similarly, the data skip feature can be used in the limit and direct searches as long as you aren't using AM mode.
While performing a limit search, you can interrupt the search by simply turning the rotary control one notch. You can then use the rotary control or the up and down arrows to tune accordingly. To resume the search in either direction, simply press and hold down the appropriate arrow key until searching resumes.
A direct search is initiated through either entering a frequency via the keypad or selecting a memory channel and then pressing the up or down arrow key. I like the direct search off of a memory channel but would have preferred if they had implemented the direct feature of the Pro-60 or the tune feature of the Pro-2042. These features allow a frequency to be entered directly so that it can be listened to just like the VFO feature found on a typical Icom Yupiterus, AOR, etc. rig.
During a limit or direct search, you have access to the Skip Search features. This allows you to lock out up to 50 frequencies that you don't want the radio to stop on while searching. There is also a handy review function that allows you to view the contents of the search skip memory. Each search skipped frequency is tagged with a number and using the up and down arrows, you can step through this memory to not only see what's in there, but to also remove frequencies so they will no longer be skipped. This is very handy and is found on the Pro-26 and Pro-2042. It makes the Uniden approach seem very antiquated and cumbersome. But be warned, if you are having a good old time putting in skip frequencies, once you fill up 50 slots, it automatically wraps to the first slot and overwrites what is already in that memory slot.

This is like the Pro-26 but unlike the Pro-2042 which simply displays a message indicating the memory is full and therefor no more frequencies can be put into the search skip memory.
Auto search works quite well and is considered "smart" in that it will not store a frequency that has already been stored into memory. Once you have the limits programmed, you select the banks you wish to store frequencies in. And you may select more than one bank unlike most Icom, Yupiteru and AOR models. During operation, any active frequency not already stored will be transferred to the next available memory channel. Searching is resumed immediately without waiting for the signal to go away. I like this mode of operation but have heard of those who prefer to stay on frequency until the transmission goes away before the search is resumed.
There are also two search speeds. The 2045 defaults to a rate of 100 steps per second. If you are searching a range which has 5kHz steps, you can press the H/S(HyperSearch) key to increase the search speed to 300 steps per second.

RF performance
After looking at the specs you get a hint of what this radio is capable of. I believe these numbers, as usual, are on the conservative side! This radio held its own against the BC9000XLT and Pro-2042 and in some cases outperformed them plain and simple! But there is always a compromise; too much sensitivity usually results in undue imaging and intermodulation problems. However, I found the compromise that was made to be quite acceptable! For the most part, the 2045 was compared to the BC9000XLT with both radios using their stock antennas.
Let's start off with a birdie check. I found 20 scanning the entire receive range which is pretty good for such wide coverage. There were 3 in the VHF lo band, 5 in VHF aero, 2 in UHF aero, 1 in US government 400, 1 in UHF lo, 5 in the 800s and 3 in the 900s.
Now let's take images. The nature of triple conversion and high IFs help to keep out your normal images. But this unit does seem to still have some problems. The worst were images throughout the VHF air band which, although very attenuated, still managed to open the squelch allowing an empty hiss to fill the speaker.
I live in a fairly rich RF environment surrounded by Raleigh, Durham, Cary and Research Triangle Park. While probably not up to snuff with some of the denser city environments, it is nothing to take lightly. The 2045 handled itself quite well. I had very few run-ins with intermod throughout the entire range with special attention to the VHF hi band. Whether the radio was using the stock antenna or a 4 foot whip mounted about 15 feet up, the front-end produced nearly identical results. Much better than my 2037 which produces garbage at 24 different frequencies due to mixings with TV channel 6 alone!
Next up is sensitivity. Like I mentioned earlier, don't let the conservative numbers in the manual specifications fool you. Comparing the 2045 to the BC9000XLT for a mix of frequencies spread across a wide range, I generated the following table :

Frequency	Winner
42MHz	2045 by a nose
123	even
155	9000 by a lot
162	2045
258	even
308	even
350	2045
418	2045
451	even
462	2045
855	2045

Remember, these results were obtained with both units using their stock antennas. Where the 2045 won, the BC9000 was usually not far behind but the 2045 usually had a stronger signal and better quieting. I would qualify the squelch tail for this unit as moderate when the squelch is set at its tightest setting. Loosening it a bit improves it a bit. It is quite similar to the BC9000XLT; not as good as the Pro-2037 or Pro-2006 but not as bad as the Pro-51.

Priority
Unlike many of the Radio Shack models which have just one priority channel, the 2045 comes with ten; one for each bank. Initially the priority channel for each bank is assigned to the first channel in that bank but this can be changed if desired.
While scanning, the priority mode can be enabled. Every two seconds each priority channel is checked for each bank being scanned. The channels are checked from the lowest numbered to the highest. If any activity is detected on a priority channel, it is monitored until that activity ceases and can not pre-empted. It is also possible to lock out the priority channels to keep them from being checked when priority mode is enabled.
There is also a review feature that allows you to step through all the priority channels for easy confirmation.

CTCSS
The Pro-2045 comes with the ability to install an optional CTCSS decoder just like the BC890XLT and BC9000XLT radios. When I ordered the radio, the dealer did not have the CTCSS board in stock. So I simply called up Radio Shack unlimited and ordered one for $40. This price is better than the $50 - $55 I have seen for the Uniden. And they look remarkably similar! It arrived in five days via US Postal Service.
Installation is easy. Simply remove the three bottom screws and the two which hold the top half of the radio on. The board plugs in firmly(just make sure you have the "legs" lined up nicely before applying pressure) and your back in business in two minutes.
Programming the CTCSS tones for each channel is straight forward and less convoluted than the BC9000XLT. One major difference between this radio and the BC9000XLT is that CTCSS is a mode for the 2045.

On the BC9000XLT, once you program in a CTCSS tone for a channel, you are enabling CTCSS decode for it. On the 2045, you can enter a CTCSS code for a channel but CTCSS decoding will not be enabled unless you turn on CTCSS mode. This is how the RELM HS200 works too.
Once you have programmed all your CTCSS codes, it's easy to see what code is programmed for each channel. Simply turn on CTCSS and use the rotary tuner to scroll through memory. If the channel has a CTCSS code associated with it(other than 0.0), the display will alternate between the frequency and the CTCSS code. Much easier than the BC9000XLT!
It works great and should prove very helpful to those who live in rich RF areas where an externally mounted antenna might help to generate undue imaging or intermod. And for those of you who still have multiple agencies on the same VHF/UHF frequency, you can use this feature to weed out those you don't want to listen to.
As a side note, I could not find a hidden monitor mode, similar to that on the BC890XLT and BC9000XLT, which allows you to more easily determine the unknown CTCSS code for an agency. It appears as though they may have removed this "back door"!

Weather Alert
Another interesting feature of this radio is its weather alert capability. The radio itself has been pre-programmed with 7 NOAA weather frequencies used in the US. And it also has the capability of detecting the NOAA severe weather emergency signals.
To start, you have to use the weather scan feature to detect which NOAA frequency is used in your area. You now select which mode you want to detect the alert form.
For normal mode, you simply press the ALERT button. The display remains lit with the frequency displayed along with the WX and ALERT indicators.
For standby mode, you press and hold down ALERT until the display turns off. I guess it depends on whether or not you like to have a night light!
Regardless of the mode, the scanner is in an inactive state for any other use. When a severe broadcast signal is detected, the radio "wakes up" and emits a LOUD alarm. The alarm is similar to an air raid siren that slowly builds in intensity and is bound to get your attention! The alarm will continue sounding until the severe broadcast signal stops.
The manual provides a method for testing the siren should you care to test the limits of your eardrums! It also mentions that the weather frequency must be received in sufficient strength to trigger the alarm.

Overall
The 1997 Radio Shack catalog price of $350 for the 2045 is, as usual, a bit steep. Especially considering you can get a BC9000XLT for that much or less these days. However, several retailers carry this radio and I purchased this particular unit for $280 which I feel is a good price for a radio with these features and such good performance.
I am very pleased with this radio and would recommend it for anyone

in the market for a higher end unit with 200 channels, auto-store, search skip, weather alert and military UHF coverage.
For some additional insights into this new scanner, be sure to check out the review by Bob Parnass in the February '97 issue of Monitoring Times.

Source record: 206537

Well, I found the program, built the interface, altered the 2006 to get discriminator output and can get pages at 97-100% all day long.

Great. Now how about MDT's? All I get with MDTSTUFF is alot of 00000000 Buffer is 0 % full 0000000000000000000000000000000000000000000000000000000000 Or in reverse I get hash. Seemingly random numbers and letters that fill the buffer normaly. I'm testing with ARDIS. No readable data has been seen yet. The .INI file is set correctly for my interface.

Any ideas from the Group Mind?

Wiggie - I currently use an AR8000 with an interface, connected to the
Radio Manager program, which will also unlock the 8000 like ScanCat
Gold. I am very pleased with the performance so far. As for the WINRadio
application, I briefly considered that route, but I was swayed by the
cost of the program and the fact that if the computer goes boink I am
without a radio, as opposed to the AR8000 that is propped up on its own
power supply. For all practical purposes, I would highly recommend the
8000 and its interface program.

You can hear all communications on the customer frequency.

The Squelch on the drive-up speaker will only open when the
external CTCSS tone is used.

Did you happend to notice if they were wearing headsets?

The newer "3M" or "GM" headset use the ISM band 902-928 Mhz
in Wide FM mode. I've never had any luck in getting them
to register on my Scout. The speaker frequencies for this
new system are 920-922 Mhz Wide FM and the headset
frequencies are 903-905 Mhz Wide FM.

Several McDonalds in my area have gone to Face-to-Face
ordering. However, most them still use headsets to
to communicate between the pay windows and pick up
window. I think the wire that you saw is used for
by Cash reqister to send the orders to the Cash register
at the pick up window.

MDT's are Mobile Data Terminals (glorified laptops) that Police & Fire dept's use to simplify transfering & accessing information. Police can access DMV (Dept. of Motor Vehicles) records, Warrents, & other information by simply using the terminal in thier vehicle. Many fire dept's use MDT's to track the calls they have responded to, what units are available, & what the outcome of a peticular incident was. MDT's have alot of uses, many more than I would probably know.

2694. Free to all Radio Amateurs

Newsgroup: rec.radio.scanner
Date: 1997-02-20 00:00:00 UTC
From: Al & Denise Waller <al@qsl.net>
Message-ID: <330CF7B0.54B3DB32@qsl.net>
Source record: 206554

Dear Fellow Amateur,

An Internet Web Server devoted entirely to Amateur Radio and associated hobbies.

If you would like a home page of your own or for your Radio Club it's absolutely FREE and will always be FREE.

This is my private computer system with the Server on a T1 hi-speed network. It's a hobbie for me
just as Ham Radio is and I'm glad to share my system with everyone.

This is what you'll get:

E-mail account that you can use locally or have forwarded to your regular account

Example: K3TKJ@qsl.net , NE3Y@qsl.net , YOURCALL@qsl.net

FTP privledges

Telnet privledge (after you convince me you need it)

Your own personal Web site....Try these working pages now.

http://www.qsl.net
http://www.qsl.net/k3tkj
http://www.qsl.net/kc8eds
http://www.qsl.net/ve7fym
http://www.qsl.net/n3wdl

Here are the rules:

1) NO COMMERCIAL USE!

2) I'm not going to write the page for you. Isn't it time you learned something new?

3) You have an Amateur License.

That's it.... If you want to try it signup at http://www.qsl.net

Need more info? E-mail: k3tkj@qsl.net

73,

Al Waller K3TKJ
Laurel, Delaware

2695. SW Mod for Pro-43

Newsgroup: rec.radio.scanner
Date: 1997-02-20 00:00:00 UTC
From: wiggie@tfsksu.net
Message-ID: <5ejbmc$nh4@lana.zippo.com>
Source record: 206555
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I had several....ok many people ask me about a mod to enable the Pro-43 to be able to expand its coverage range. Yes, it is a good mod and doesn't take away anything to achieve something. The best way to find modifications for the Pro-43 or any other scanner is to do what I always do and either figure it out myself after a few hours with the schematics or to go to www.altavista.com or any other type of search engine. Placing "+pro43 +mod +scanner" in the blank will get you going in the right direction....but since I am in a pretty good mood I will this time point you directly to it. I can not take credit for this modification but I have done it on a few Pro-43's and have enjoyed its added benefits. You can find the file at http://ftp.barc.org:8080/pub/hamradio/mods/tandy/ and you will find it under the zipped file pro43swl.zip.

Good luck

Wiggie

Actually if he/she/it is writing software then they are in the
original sense of the word a hacker and I wouldn't call that negative.
However the point of the software was to "break into" the
communications so calling them a cracker might be more appropriate :)

> Is it just me, or is this a recognized phenomena? Does anyone who has
> experienced the same thing know of a model that doesn't do this?

No it is not you. The fidelity of analog phones is usually better than digital (most of the 900 units are digital). An full quieting signal on an analog FM radio will sound better than the same voice range on a typical A/D - D/A radio.

The problem with analog is distortion when the signal gets noisy. In order to give you good sound, an analog receiver has to receive a clean signal. When it does receive a clean signal it sounds great.

A digital receiver can put up with some distortion in the signal. Ones and Zeros can be recovered from a noisy signal. Once you have the data, the analog can be reconstructed with consistant quality.

Regards

You were breaking the law. It is a bad law I admit, but you in
violation.
Second, you do have an obligation to give him the time of day. Your
actions
could be considered supicious. Maybe he thought you were a stalker or
someone
preying on childern in parks. Yes he had every right.

> I wasn't going to give him the conversation I had taped 20 min before he got
> there about some criminal that was in the area just to have my scanner taken
> from me.

Do you use celluar phones? Protest by not using them. Write a letter
to your
local celluar company listing that fact. You taped a phone
conversation, you
broke the law!

> That's what the new scanner laws have done. Thanks a lot you dems. You're
> increasing crime.

The laws date back to sometime in 34 and they are not new. Plus if you
think
it is the "dems" fault you had better look who lobbied for the "new"
laws.
Plus there are more "repub" in Congress. If you can say you are totally
republican, then you don't read the issues very well. I can't belive
any person is so cut and dry that they fit the description of 100%
repub or 100% dem or what ever label you try to fit on a human. Get
real and
get out of your car and read the issues.

Your sentence (if you call it that) states, and I quote,
"Look up what an I.F. and do some reading." Look up what an I.F.?
Are you asking me if I understand what an Intermediate Frequency is?
You mean the principle of heterodyne mixing, the thing that the
DOWNCONVERTER does? :) Perhaps you actually _are_ a rip-off, not
just a person trying to sell free information. :-/

In your next message to me you state...

george ford wrote:
>
>Gee Steve you must be smarter than me. Yah.

I am an electrical engineer. I am going to guess that your
money making scheme is about the same as the MAKE.M0NEY.N0W posts we
see here all the time based upon your responses. If you have a unique
non-heterodyne mixing method, or non-scanner specific modification
technique, please detail as much as you can here. I'd be interested in
hearing what you have to say, but _please_ attempt to make your comment
a bit more coherent than "Look up what an I.F. and do some reading."

Ham Operator wrote:
>
> Why pay Ramsey any money? Do you work for Ramsey or something?

Why pay YOU any money? At least with Ramsey, you know you are going to get a quality product that works. From "Ham Operator", who knows what you are going to get. I like your price, $15, the universal scam amount. This is the maximum amount of money you can charge and NOT get investigated by the postmaster general for mail fraud. Perhaps you knew this, perhaps you didn't. Charge $20 and you can go to jail for mail fraud (a felony).

> Everybody knows about downconverters.. Duh....

Not everyone knows about them. Every time I enter a Radio Shack and see someone asking about scanning cellular phone traffic, I tell them about Ramsey (you can order Ramsey stuff through Radio Shack by the way, makes it convenient) and they look suprised and excited.

> The knowledge is something you think you know but you don't.. You
> missed it completly. I suggest you do some more thinking. Don't buy
> a Down Converter. You don't have to!

Why don't you tell us how your system works? Or does it work like this, I send you $15, and you put me on a list? :) Answer my question in this newsgroup if you have one.....sq

scanner law someone proposed...no they BOUGHT..wave money in front of leglislators or congress or regulators..take them to a seminar on "privacy and technology" where you provide FREE hotel, air fare etc....a way to BUY access to the people you want....works every time

hey, the tobocco industry did that in Scottsdale AZ recently..they don't like some Arizona cities smoking ordinaces that ban smoking in ANY public place.... me personally I don't Smoke..never have....

just listed that as an example of how industry lobby groups buy access to lobby their cause.

> charitable contributions. :)

That should be "you can order some pizzas using a phone patch if it is
for, say, the American Red Cross for use in feeding people in shelters"
-- as that is not technically considered "business use," but rather, "use as
an aid in the furtherance of public service." In this case, it's helping to
keep clear the main phone lines for more important and immediate emergency
use.
However, ordering a pizza over the phone patch for consumption by yourself
and/or your friends...that's not really a lawful use of a phone patch, and
could end up getting the repeater Control Operator in trouble, as well as
yourself. A growling ham's stomach, unfortunately, is not one of those
things considered by the FCC to be an "acceptable emergency." :)
Most control operators, though, will cut such a phone patch conversation
off in the middle is they hear it going on when there is no emergency...just
to be safe. Because there is always some confusion over that very thing for
some reason. And I hear it attempted far too often by newly licensed hams
just off of the testing line.
I think if we're going to become hams, we shouldn't just memorize the
answers just to pass the test; we should LEARN the answers behind the
questions to _fully understand_ them. Else, the license we obtain is a
lie...a cheated acquisition.
That's why I hated to see the code requirement go. I figured, if people
wanted the license bad enough to learn the code, they'd be interested enough
to know and fully understand the theories and rules as well, by studying
things just a hard. And it seemed to be true. And for most, the code was
hard. Before the dropping of the code requirement, I have to say that the
hams you'd see were far a more serious group of people. The code was
another kind of test....A test of initiative -- of willingness to learn all
there is about the hobby.

It's more than $200, but I can't say enough good things about Radio Shack's Pro-60. They're on clearance for $250 (reg. $380) and a fine HH. My Pro-60 has triple-conversion, Hyperscan, 200 ch., 800MHz (less cell), continuous coverage from 30-512MHz (which will give you military aircraft). It's got AM/FM/WFM selectibility, and is very sensitive. Easily RS's best ever.

Darrell, you obviously haven't been reading the MDT posts lately.

First of all, Motorola MDT's are not ENCRYPTED (which is the restriction placed on Munitions). They use 20 or 30 year old encoding schemes. Encoding, or scrambling, is used to increase the reliability of the reception, not for security.

Over the last year, several companies (including L0pht) have started selling interfaces that will enable you to decode digital pagers, and now MDT, and Trunking control signals.

Thirdly, the source code for much of the above has been circulating for months.

Several people are also distributing programs that run on your sound card.

H Higgins

P.S I just saw info on the EDACS protocol postedtoday. It probably won't be much longer for that too.

Well, I I think I hold some similar opinions about law enforcement. I dont know if the LAPD interecpted any calls. Some people commenting in this thread seem to think they did not intercept any calls. I guess SOMEONE would have had to intercept somthing in order to have a recording of it, right? I think cops break more laws per capita than the general public. We must educate the general public as to the extent that this is true. How many rodnet king, Johnny gammage type incidents will it take for people to realize that we need a police dept. to police the police dept more than we need a police dept. to police the citizens. I dont know if you agree with my views or not, but please dont hold it against me that I am an "AOL'er". Do a search using Dejanews of this news group--look for "SCANNER ACTION BUSTS" I use the scanner as a tool to catch and expose cops that blatantly entrap and violate the law.

I'd be interested in knowing what you think of it.

If anyone is interested, the following four locations broadcast
directly to the internet using the free, Real Audio reciever.

Dallas Fire Department
Dallas Air Traffic Controlers
Dallas Police Department

Los Angeles Police Department

In an attachment, I have included a zip file that contains
the location for all four transmissions. If you have already
downloaded and installed the Real Audio receiver, then
you can click on the files in the Zip file, and listen to the live
action from that location.

I put these files, along with many other radio and TV locations
in my (Windows/Favorite) folder, so that I can call them up
directly from my 'Favorites' drop down menu located at the top
of my Internet Explorer Browser.

I've read a bit of the exchanges expressing outrage at the FCC's regulations regarding cell phone monitoring, equipment which can receive cell freqs, etc. Much of it sees the restrictions as an affront to individual liberty.

This seems a bit contradictory to me. Don't people using cell phones also have a right to be free of eavesdropping? To use an analogy, how would those who insist on the right to monitor cell freqs view the tapping of their hard-wired telephone lines? Does one have a right to eavesdrop on private conversations using a parabolic microphone?

It seems to me that the FCC regs rightly protect individual freedom and privacy.

I hope that this leads to a reasonable discussion, but just in case I now I put on my flameproof suit...

This is true. However, given the current trends of our congressional "representatives", don't be surprised if someone accuses you as violating "the spirit of the law." The law doesn't mention it, but yet you're guilty because some Congress critter assumes and interprets the law to mean that what you're doing is illegal.

This is exactly what Markey and his cronies pulled on Bob Grove. Beware!

Probably image receptions, or something of that nature. That would be the
why for of the one sided heard too. On an autopatch you should be hearing
both sides of the conversation. Many scanners and the new dual band, barn
door front ended, ham recievers recieve many too many images where you do
not like them.

Fred ke8tq

I may not always agree with what you say. But I will defend to the
death your right to say it.

Check to make sure you didn't accidenteally lockout all your other channels by botching the reprogram. Happened to me once. Start by turning the unit on, then enable the different banks one at a time. Hit the manual key and access bank 1 channel one. Check it for L/O. Hit bank 1 channel two and check it for L/O. continue through the first two banks. You may have accidentally wiped out all the freq's from the unit also. Just enter in manually a busy local frequency or a weather channel into the first bunch of channels for the first few banks. After you have reset the L/O on these channels, try to resume scan by hitting the scan key. If this solves your problem go back to programming mode by PC and make all the changes from there, it's faster.

2731. 900 Mhz phone info

Newsgroup: rec.radio.scanner
Date: 1997-02-20 00:00:00 UTC
From: me@not.here.com
Message-ID: <330C7917.16B8@not.here.com>
Source record: 206601
Cross-posted to: rec.radio.scanner,comp.dcom.telecom.tech,alt.radio.scanner

I hope everyone isn't getting sick of 900 Mhz phone rambling. I just find this technology very interesting and am looking for discussion :-)

Now that I've had my Toshiba FTH955 (same as VTech 900 NDX) for a month I've been able to test it out quite a bit. The FTH955 is a 10 channel autoscanning all digital phone (but not spread spectrum). Anything I mention about spread spectrum (SS) phones comes from my testing of an Escort Courier 9100 SS digital phone.

Observations:
IMO, sound quality is plenty good enough, comparable to analog phones and corded phones. Many have complained about the 'echo' in digital phones. This seems to vary from phone to phone and person to person. IMO, the Toshiba has no echo and the Escort 9100 has a BAD echo.

Spending the extra money for an all digital or digital spread spectrum model is worth it. The complete lack of static or interference in the transmission is amazing. Sometimes I forget I'm using a cordless phone. There is no comparison to 46/49 Mhz phones.

The extended range is impressive. Even on my city block with lots of houses around, I still get an ultimate range of about 500 ft which is about 2-3 times the range of my old GE 10 channel 46/49 Mhz cordless. At about 200 ft, the GE 49 Mhz was useless because of all the static (even with Compander noise reduction, BTW). At the same distance, the Toshiba 900 Mhz is clear, just beginning to experience occassional 'digital dropout'. With the SS Escort 9100, range was better at 700 ft or so but SS seems to be better at 'punching through' obstructions to maintain a usable signal for a greater distance. If range is very important to you, go with a SS phone. If you never intend to take the phone farther than your back yard or a neighbors house, then a regular 900 Mhz digital will be more than adequate.

The range of these 900 Mhz digital phones is very 'line of site' dependent. If you are outside, looking straight in the direction of your house and if you see lots of things (like other houses, buildings, etc) blocking the view of your house, then your range is going to be limited. The more objects in the way, the less range. The 900 Mhz signal doesn't like to punch through too many objects. If your house is clearly in view then your range should be excellent. The SS phones are less susceptible to the line of site problem and seem better at punching through obstructions but, of course, they are not totally immune. I wish I had a second home on a farm so I could put the base unit on the back deck and walk straight out into the field to see what the ultimate range of these phones are when there are absolutely no obstructions in the

line of site. This must be the type of testing manufacturers do to come up with those unbelievable range claims like 'up to 1/2 mile range' or 'up to 8 times the range or traditional cordless phones' or 'up to 4000 ft range'. I guess the key words are 'up to'.

Now that I've had my Toshiba FTH955 (same as VTech 900 NDX) for a month I've been able to test it out quite a bit and now have a few questions I hope someone can answer. The FTH955 is a 10 channel autoscanning all digital phone (but not spread spectrum).

I've noticed a clicking sound in the ring when I'm calling someone. The clicking sound goes away after a connection is made. Is this normal for 900 Mhz digital phones?

Is it possible to extend the range of the 900 Mhz digital phones? My base unit is currently installed on the first floor (of a two story house) in the middle of the house. Would moving it to second floor help noticably? Is higher generally better? I get the impression that the length of the antenna isn't that important for 900 Mhz phones since the antenna on my base unit is non-telescoping and only about 5 inches in length. Does anyone have any experience with external antennas? I saw an external antenna for $60 in a 'Hello Direct' catalog designed to improve range but they don't really say how much it will improve range. What about an antenna on the roof?

When doing range testing I noticed that at the limit of the phone's range sometimes only one side of the transmission gets through. In other words, the base unit can hear the person on the handset but the person on the handset can't hear the person at the base unit or vice versa. Why does this occur? Is it because two channels are in use? Another thing I've noticed is that if the handset is out of range, pressing the intercom button on the base unit to signal the handset will sometimes cause the handset to ring but the handset can't establish a voice connection.

Thanks in advance.
Len

Yes...and do I have the right to have my conversations private from a
lip-reader with binoculars???...and do deaf people who sign have a right
to privacy from people who can see? If you can answer all these
questions
with a _yes_, then you may expect privacy, on the other hand, you may
not _reasonably_ expect privacy in many cases, and this is where the
argument is-in what is reasonable...

I live in Italy, where since 1 month there is a limited availability of
IC-R10. Since it's a cool toy, all units are sold out as soon they arrive at
the stores. I booked one in January, and two days ago I got it. I paid it the
equivalent of 412US$. As a price comparison, the AR8000 is quoted around
600US$ equivalent at the same store.

Here below you can find the results of my personal tests. I assume the reader already knows the main characteristics of the device.

FIRST IMPRESSIONS:
First I was impressed by the small size, the light weight, the display readability, the well spaced keyboard with visible labels, and the nice look.
RADIO SECTION:
The receiver seems a good one, far better than my previously owned IC-R1. Still some intermodulations with external VHF/UHF antenna (a periodic log), drastically reduced with the help of the attenuator, and acceptable sensitivity (IC-R1 was better in sensitivity, but useless due to poor selectivity and intermodulation weakness also whith the rubber-duck antenna). Performance in HF (tested only on 40m band) is generally good, considering the size of the hardware. My external HF antenna (a 40m band, 1/2 lambda dipole) cannot be handled by the receiver front-end, even with the Att. ON. A little improvement in SSB with Att. ON and reducing RF Gain , but unfortunately this cannot be achieved in AM (the squelch control act as RF gain in SSB and CW modes only). A smaller external dipole (1.5+1.5m), even not resonating at 7MHz, as given a very good trade-off between front-end overloading and weak signals sensitivity. A good portable solution is a telescopic antenna with BNC connector having a practical lenght not less than 1 meter. A shorter whip antenna (as the one supplied with the unit) is seen as a too small capacitor at low frequencies, and thus the low impedance of the front-end will zero any signal the whip catches. Further improvement in portable HF listening if the receiver could benefit of any ground counterpoise: it is enough to plug-in the external power supply cable (not mandatory to apply 12V for RF!) in the specific socket to strenghten all HF signals.
My overall statement is that this is an handheld scanner only (!), and it is better to rely on it just for portable or mobile use with the bare BNC antenna or a car-roof antenna.

The SSB reception brings along some PLL noise, and the rejection of unwanted lateral band is poor. I don't have instruments to test both parameters, I usually listen SSB by a Kenwood HF transceiver...but I cannot bring it with me on the beach! Nevertheless, 100 Hz steps are good enough and frequency stability is OK.

The audio from the speaker is compatible to its size. IC-R1 was a little better. Higher tones, such as selective call tones, come sligtly distorted. I've sometimes noticed some CPU noise in AM (it changes pitch when you push any key) , and a repetitive (cyclic) noise in FMN when SIGNAVI is active (not a problem: SIGNAVI seems a useless feature).

I didn't analyse accurately the AFC and ANL performance. I've just seen that AFC works digitally by adjusting the actual frequency on the display if the received signal is off-tune. Maybe this function is needed above 1GHz, but the capture range seems to me too small (just a marketing tool?).

The self-generated carriers (I hate them) are really few. I made a comparison with the AR8000 and I will write a specific artichle on this topic if I will find the time to do that. The AR8000 is really poor on this aspect (but only this, apart of its size and price!), while the IC-R10 shows a good receiver

and shielding design.

One more detail concerns the supplied rubber-duck: I roughly compared it with a similarly sized one: the RH700 by DIAMOND. In HF and Low VHF the two whips are similar (very poor); in High VHF the RH700 is far better; in UHF the RH700 is a little better; in 900MHz cellular band are similar again (both OK). Thus, as an average, the original whip seems poorly designed. Maybe Icom intends wide-band antenna as a flat -10db gain over full-range frequency.

OPERATIVE SYSTEM:
The firmware is a big "flop"! I'm reeeeally disappointed by this aspect.
I don't speak about bugs: the programmer(s) simply didn't have a scanner in mind. My needs are generally few, I don't look for a portable super-clever scanner as the AR8000 is (really complete and flexible firmware), but my dual-bander portable transceiver YAESU FT51-R has a scanning operation even smarter than the IC-R10 for some aspects. Unfortunately it hasn't the same memory size and band coverage, but I often use it as a scanner and I'm pretty satisfied. Furthermore, if it locks on a friend of mine speaking, I'm able to talk with him too!
Here I list the MAIN faults the programmer(s) did, in my opinion:
- All 1000 memory channels can be named by a user 8 chars alpha string, but there is no way to see this name while memory scan is running. Even if a signal pauses scanning, the name stays hidden: the S.meter uses all the 8 digits to draw a very nice bargraph! To see the name, you have to definitively halt scanning and dial up and then down (!) or enter in memory channel edit mode just after halting.
- Similar problem in programmed band scan: the 8 char. user string who names each one of the 20+10 scan limit and options memories is not displayed while the band scan is running neither when it is paused by a signal.
- Memory bank scan can be performed just within one bank at a time or on all banks together: that's a big limitation. The user could try to arrange some banks organized by "event" only for scanning purpuoses and run one of them according to the situation he is facing, but there is always the maximum limit of 50 channels/bank.
- If you halt the programmed band scanner or the bank memory scanner and you want to restart it, you must redo the complete procedure of choosing the band or the bank even if you want to use the same band or bank again. Furthermore it doesn't restart from the point at which it was halted.
- The auto memory write scan always clears the target bank (fixed=Q) even if there is room for other frequencies.
- Scanning options are few and are not selective. One example: the voice detect pausing (named VSC), once set, applies to any scanning modes you run, while I could need it only on some selected channels. Also delay and pause options are not flexible at all...I don't go in detail.
- Set Menu is very poor: 11 items, and 3 of them are devoted to interface setting. That should be the best tool to personalize the operation of the unit, but it is a pity. My YAESU handheld transceiver FT51R has a 24 items set menu. I can even choose if the backlight must automatically turn ON if squelch opens, for example. AR8000 user personalization is implemented differently, not just on a setup menu. It is at very good level, yet not very friendly to the first-time user.

- The band scope implemented has only one good point: it works without ever stopping the reception of the actual frequency you are tuned on, so it is different than the AR8000. Everything else is a fault, because it works only in NBFM and the maximum channel spacing is 20KHz (they could reach 25KHz, it wouldn't be a huge effort!). If your actual VFO step is more than 20KHz, the tuning steps are kept, but the band scope uses 20KHz spacing (it's foolish!).

There are other minor inconveniences I don't mention, and perhaps others I don't know because I haven't yet experienced all operations of the unit (priority, interfacing, for example). I will update the list if necessary.

GENERAL FEATURES:
Scan speed: the Manufacturer declares 16.7 steps/sec for band scan and 6.25 ch/sec for memory scan. I assume it's true, since no scan timing is user modifyable. I've just tried to compare the band scan speed by running the IC-R10 in parallel with the AR8000 in newuser mode. Both were without antennas. The former is about 20% slower than the latter, but the test wasn't easy to run because the AR8000 very often locks on its self-generated carrier. I didn't ever try the memory scan speed comparison: I should clone manually a memory bank from the Icom to the AOR (too boring).

Power consumption: according to the specifications: 110mA in st-by (power save OFF), 180mA audio ON.

Batteries: the unit is sold along with 4 AA 700mA NiCd cells. The unit charges them if the small switch inside the battery compartment is ON, and the charging current is 70mA. So it is a standard charge rate for the original cells. If someone (as I do) prefers to use the 1200mA NiMH cells, he has to charge them outside the unit. I guess it is possible, by opening the unit and thus voiding warranty, to modify the charging current. The problem will be to find the right resistor to be replaced: maybe one day I will try. The unit shuts-off automatically when the cells are exausted: this could be helpful to fully discharge overnight a set of NiCd without damaging them.

Keyboard: It's well spaced and labels are easily redable. Backlighting is good for both display and keyboard, but unfortunately there is not a specific key to switch it on. From the set menu (!) you can turn it always ON, or timed: 5 second ON whatever key you push. Maybe in the dark you push the wrong key!
I would appreciate the keys being labeled also with the alpha characters they enter when editing memory channels. It's hard to me to remember the arrangement, and since there is no provision of backspace, I often lose a lot of time.

CONCLUSIONS:
The IC-R10 seems to me a marriage between a good radio design and a poor embedded software analysis/development. It could be an attractive solution for portable scanner users in terms of size and price, but Icom has to release soon an updated firmware version if they want to be really competitive.

NOTES:
In this artichle I have mixed personal opinion together with test results. Even if I tried to be as unbiased as possible, someone may find something is wrong, inaccurate or, at least, discutible. I'm not commercially involved in any field concerning radios, transceivers or scanners. Radio is for me a mere hobby (the first) since 1972. I'm a licensed ham operator who designed and built his own VHF and UHF transceivers/transverters, and bought commercial receivers, transceivers -mainly portable- by Kenwood, Yaesu, Standard, Icom. My scanner experience is limited to my previously owned Icom IC-R1 and an AOR desktop scanner (an old one, don't remember the model).
The AOR AR8000 used as comparison seemed to me the closest competitor to the Icom IC-R10, furthermore I had the opportunity to get one unit in loan for just one day, perhaps a short time to become familiar with it.
Comments from the readers are welcome.

2739. PA scanner cops start their investigation

Newsgroup: rec.radio.scanner
Date: 1997-02-20 00:00:00 UTC
From: tyler@cyberia.com
Message-ID: <5ei1bn$mo7$2@news3.microserve.net>
Source record: 206609

I was scanning in my car while parked in a public parking lot yesterday when a PA state cop pulled a pick-up truck into the lot. He gave the guy a ticket and then asked to see MY license and registration. I gave it to him and he wanted to know what I was doing. I told him I was listening to my scanner. He wanted to know what EXACTLY I was listening to. I wasn't about to tell him I was listening to cordless and cellular phones so I told him police and fire bands. Well, he ran my license and registration and found out that I WAS NOT the hardened criminal he thought I was. He was curious as to what I was up to. Understandibly so...with 3 antennas on the car and a bunch of scanner equipment that has wires running everywhere. He let me go and I wondered if I really had any obligation to give him the time of day? Anybody know? Any comments?

I wasn't going to give him the conversation I had taped 20 min before he got there about some criminal that was in the area just to have my scanner taken from me.

That's what the new scanner laws have done. Thanks a lot you dems. You're increasing crime.
TYler

>
> http://www.ggw.org/nf2g/laws_on.shtml
>
It refers to the Criminal Code of Canada. You can search the Code at the
URL=http://canada.justice.gc.ca/folio.pgi/estats.nfo/

The sections refer to wiretapping and wiretapping equipment, not scanners
The wording of the law states devices designed solely for the purposes of
intercepting private conversations. Scanners are wide coverage radios that
do receive public broadcasts as well (ie; Weather, ATIS etc..). It is
illegal to Dilvulge what you have heard or to use the information for profit
so in Canada it would be illegal for a tow truck to use a scanner to jump
a call, but they all have scanners and they all do just that.

2742. Washington Post Article Damning Scanner Listeners

Newsgroup: rec.radio.scanner
Date: 1997-02-20 00:00:00 UTC
From: larry@grove.net
Message-ID: <5ehvrj$4jo@news2.his.com>
Source record: 206612

I'm sorry on this one folks, but I just couldn't let this one sit in my in basket. I'm sure Mr. Stoltz is lonely out there and really needs some of us to break up his lonely life with the joy of responsive and though provoking email via the internet.

I didn't see this posted to any of our newsgroups, but it should have been. An MT reader forwarded a copy of this Washington Post bylined article from the Fast Forward section of the paper. This was published in the January 24, 1997 edition of the Post. and it was titled "Scan You Dig It." It was written by a Mr. Craig Stoltz (email address: stoltzc@washpost.com)

This article is long but pay close attention in particular to the opening salvo regarding his view of all scanner uses. The nicest bit of stereotyping I have seen done in quite sometime. I hope this doesn't go unchallenged and the Post should hear from all of us today. Since this is the newspaper most read by congressional staffers in DC is it any wonder we get the short end of the stick.

Oh yes and before I forget it as psrt of the public record the last time I checked the Post Group, Inc owned majority interest in a company called Moffett, Larsen, and Johnson (one of the largest cellular/pcs industry engineering firms in the country). Hummm wonder how Mr Stoltz's pension fund is looking and what conflict of interest one could draw from all this. (Sorry to ramble on).

==========Begin Washington Post Article==========

Scan You Dig It?
By Craig Stoltz

If you thought America Online chat rooms were a shameful waste of human potential, just think about the folks who monitor the public airwaves with radio spectrum scanners. There may be as many as 20 million of them in the U.S.--more than say, regularly navigate the World Wide Web.

Take, for instance, that Florida couple, the Martins, who (somehow!) intercepted and (somehow!) tape recorded a revealing cellular phone conversation among Newt Gingrich and fellow Republicans, Others will divine whether the Martins were lucky hobbyists or party stooges. But I'm curious about people like the Martins, folks who apparently choose to entertain themselves by listening to the hellscratch of human voice bouncing across the radio spectrum.

According to Bob Grove, publisher of Monitoring Times magazine and source of the 10-to-20-million-scanner estimate, "In some parts of the

country, like around here [mountainous Brasstown, NC], it's hard to find a household that doesn't have at least one scanner, maybe two or three."

Unfortunately, a firmer number proves harder to lock onto than a Gingrich 411 call. Neither Uniden, the biggest U.S. scanner supplier, nor Radio Shack, the largest retailer, reveal sales figures. An industry insider, declining to cite a source, says 1 million scanners were sold in 1995. Norm Schrein, president of the 12,000 member National Bearcat Radio Club, cites an early 80s estimate placing a scanner in 7 percent of U.S. households; applying that figure to today's population assumes 8 million scanners. Grove's company maintains a national mailing list of 100,000 scanner enthusiasts.

The better question is why anybody uses one. Schrein says 90 percent of first-timers use a scanner to monitor "their neighborhoods--police and fire, taxicabs, utility companies" and so on. (See Radio Shack catalog pitch at left). We're talking a very high noise-to-signal ratio here, with many transmissions of numbing mundanity. "Most people say they learn things they can't get anywhere else, like where burglaries are, where drug traffic is, that sort of thing."

Around 10 percent of entry level users become true scanner enthusiasts, Shrein says, upgrading to more powerful devices, trading lists of frequencies (hospital, aviation, military and business codes appear in books, magazines and on the internet) and, sometimes, graduating to the shady art of picking up cellular calls. Since 1994 it's been illegal to make or sell scanners that can, or can be easily modified to, pick up calls on 869-894 MHz sliver of the radio spectrum where cellular calls ride. But used pre-'94 models are always for sale, and some full-spectrum units arrive from overseas. Several businesses, including one run by Grove, will perform a "full-frequency restore" to newer units for a fee. But, in fact, most new scanners pick up cell phone calls anyway due to technical factors Tandy Corp. calls "transmission phenomena." In other words, if you want to listen to cell calls, it's easy. Any if you don't, you'll probably hear some anyway.

Schrein, who lives near Wright-Patterson Air Force Base outside Dayton, Ohio, says he's picked up some interesting stuff from the legit frequencies. When the Bosnian peace accords took place in Dayton, Schrein was able to monitor base security frequencies to learn that Serb leader Slobodan Milosevic "was going into town to buy shoes." Of course, such memorable highlights come at a price of constant monitoring of daily false fire alarms, utility truck maneuverings and god knows how many honey-will-you-bring-home-a-loaf-of-bread cell calls.

"Actually, I'm getting a little tired of it," Schrein confesses. "You can get kind of burned out."

The ECPA 1986 (Electronic Communications Privacy Act) was passed due to lobbying of the Telco's they had been promoting cell phones under the false pretense that communications were as secure as a regular landline call. They still don't refer to cell phones as simply a UHF Trunked radio service. When scanners with 800 Mhz coverage appeared, the cell companies were caught in their little white lie, so with $ billions to lose they lobbied congress, to have they cell frequencies declared off-limits... The ECPA was passed, and if you noticed channels 72-83 on your TV UHF dial also vanished (you can monitor cell on older TV's). They also lobbied and had the April 1994 ammendment to the ECPA passed to cover cordless phones, pagers and misc other devices.

> figure out.

Actually it is still illegal. You cannot modify any part 15 device to
operate outside of its type acceptance. Even if part 15 allows a baby
monitor to work at 1 watt, if the TA for the one you have is .1 watt it
has to stay that way.

Modifications can only be made by the type certificate grantee (read
"manufacturer").

Is anybody making 900MHz baby monitors? 900 spread spectrum would
probably allow parents to roam quit far from their sleeping
babies....probably too far. How far away from junior do you REALLY want
to be???

On the Uniden Bearcat UBC 9000 XLT there is 1 priority channel for each bank, this channel is marked with a 'P' in the middle of the upper display. On the scanner there is a key PRI, when using the key there is a inverted 'P' on the upper display in the left corner. What dos this key do and why there is a inverted 'P' and a normal 'P' on the upper display ?

Thanks,

All further information is also welcome about this scanner.

2748. MODS for BC 3000

Newsgroup: rec.radio.scanner
Date: 1997-02-20 00:00:00 UTC
From: n2ofn@aol.com
Message-ID: <19970220185600.NAA24255@ladder02.news.aol.com>
Source record: 206618

I am wondering if there are any mods to the BC 3000 that will "narrow" the receive bandwidth on 900 Mhz. When I try to scan frequencies in the 900 Mhz range...935.4500 I get bleedover from 935.4375. This problem does not exist on my AOR 8000. Can a sharper filter (if there even is one!) be installed in this radio to reduce the bleedover? Does anyone know of any shops that do these kind of modifications? Any ideas or suggestions?

Follow these easy steps:

1. Unplug receiver

2. Carry it with you to the room that mom is in. (most likely closer)

3. Plug it in.

4. Go back to computer room and finish your work undisturbed.

5. If receiver is wireless, skip steps 1 and 3.

But seriously though, these units are horrible at best. A previous post said that the unit is probably not putting out the full legal power, and I agree. I believe the legal power output on the 49 Mhz band is 80 milliwatts, which should be more than enough to go 50 yards. I have a pair of Radio Shack 49 Mhz walkie talkies, which I used as a baby monitor when my daughter was born. I believe that they are rated for full legal output power. They claim 1/4 mile range, but that is streaching it just a bit. They should very easily cover the distance you need, though. I hooked the unit in my daughter's room up to a 9 volt battery eliminator, and I used a rubber band to keep the unit transmitting. I had to put a small object between the rubber band and the push to talk bar, because the PTT bar did not stick out very far. (I think I used a piece of rubber eraser)

They worked so well that I had a conflict with a women across the street and down a few houses. I was actually stepping on

her baby monitor that was on the same frequency. Since she just bought hers, I told her to take it back and exchange it for one on another channel.

: over here...good luck!

Sheesh.

Ok, it's like this.

If you want to pick up a signal from a digitally encoded cordless
phone, you need to have not only a scanner for the RF side of things,
you also need a vocoder _which uses the same coding scheme as the
phone_, and a wide-band enough output to hook it to -- the audio output
of the scanner is almost certainly not wideband enough.

Because there's no industry standard for how to wrap that stuff, there
are _no_ commercially available "digital scanners", and I'd be
exceptionally surprised to find out that a turnkey solution was even
available to the "surveillance" market.

It would therefore be awfully hard to buy them anywhere, whether they
were illegal or not, which, knowing our goverment, wouldn't surprise
me.

>How about voltage? What value resistors have you used with the
>discriminator output of the 2006 (TP2) with good luck?

You may not be on the correct frequency. For example PD203 won't decode FLEX paging signals. MDTSTUFF only decodes MDC4800. Other signals may sound similar, but not be the same.

As for the circuit, remove the 100k and 10k resistors in the feedback circuit, and tie the (+) input directly to ground. Also be sure the power supply capacitors are as close to the opamp as possible.

My problem is not my decoder , but the fact that I have very few MDC4800 transmissions around. Reading appliance repair messages gets very boring, real fast.

Let me know what happens.

Mark

Can you give a little more information. What frequencies are dead? Do you get anything on those frequencies on FM? Are you in a rural or urban area?

By way of background to explain why I ask these things - there are, of course, two basic forms of modulation - Amplitude Modulation and Frequency Modulation. Classic AM modulation produces an Upper Side Band and a Lower Side Band which are identical. Except for commercial entertainment AM, it is typical that just one is transmitted and this is called Single Side Band whichever one is used. Or said more simply, USB and LSB are two forms of SSB. These are commonly used in CB and HF amateur radio bands.

I have been talking about various forms of AM. The services on much of the scanner frequency spectrum use FM which explains why many lower cost scanners only receive FM - the most bang for the buck. If you are tuning to frequencies where FM is employed, there are no AM SSB signals to receive. Set your receiver for FM operation.

If you are in a rural area signals may originate far away and you may need a good antenna. In an urban area, you should be receiving something if your AM/FM switch is set appropriately. That's not to say a better antenna isn't useful in the city, just that you should be getting something with your rubber duck which would prove the radio is working.

There are a zillion kinds of antennas and I'll bet you can find some ideas at your library or else drop by a Radio Shack. Even if you want to build instead of buy, you can get some ideas by looking at some commercial designs.

Good luck
Jim

2766. FS: Two Frequency Inversion decoders and 800MHz downcoverter

Newsgroup: rec.radio.scanner
Date: 1997-02-20 00:00:00 UTC
From: ae826@leo.nmc.edu
Message-ID: <330bd56f.0@zeus.moa.net>
Source record: 206636
Cross-posted to: rec.radio.swap,rec.radio.scanner

I've done some more digging through my scanner box (you know the one with all the cable and parts and radio's and stuff....)

I recently put up for sale a scanner with 800MHz downcoverter. I got a good offer on the scanner and broke up the set so nobody purchased the downconverter. This device will allow you to receive most things in 800MHz including that bad place where we can't legally go. It works by taking the signals in 800 and downconverting them by 382 MHz and placing them in the UHF band that all scanners have. It has a Motorola male connector that will work with older scanners, or you can chop it off and put on a BNC. It works fine, but is no substitute for a good 800 scanner. I would like $50 and you pay COD shipping via USPS.

I also found a couple of projects I built a few years ago while in college.

I have 2 frequency inversion scrambler/descramblers. They both have unique personalities:

One I built to mount to one of my base scanners and connect to a 12V power supply. You need an external speaker and 12V source. There is a tuning pot that allows you to tune the correct tone to accomplish descrambling. It is built in a radio shack project box about 6 X 2 X 1" and has a Female mini plug to run a patch cord from scanner audio out to audio in on the box and another female mini plug to connect to an external speaker.

The other is for portable use. It is built into a transistor radio case about the same size as above. It has a 9V battery compartment and internal speaker. It has a miniature phono plug to go right into the audio out of your handheld. It also has a tuning pot for precise tuning of the tone.

Both units are the same circuit that I mounted in different enclosures for my two uses. Feel free to rework them, but they are in attractive enclosures.

I no longer live in the town that uses this type of scrambling on the police band, so I want to sell them to someone that can use them. I have also had luck using them on my former secure-clear phone. I took the phone back once I found out how secure it really was!

They can be used as a pair to encode one side of a conversation on one end and decode on the other end of an audio link (telephone, radio, direct wire etc.). The decoded voice is not the quality of the orignal, this is caused by stripping off of some of the audio bands needed to accomplish encoding.

I would like $50 for the pair or $25 each with preference going to someone that wants both. You pay shipping USPS COD (about $10 because of COD charges).

I'll pay shipping if someone takes the whole lot for $100.

Tom N8LFZ

PS: Now maybe I'll have room in my box for some new scanners!

2768. Re: Scanner interference by computer

Newsgroup: rec.radio.scanner
Date: 1997-02-20 00:00:00 UTC
From: jeffmulter@aol.com
Message-ID: <19970219202600.PAA02015@ladder02.news.aol.com>
Source record: 206638

Is the scanner connected to the computer for use with a scanning program?
If so,
the interference may be from the proximity of the scanner and the
computer, the
cable between the two units, or from both paths.

If your scanner is connected to the computer, check for the interference
with the
cable hooked up, and with it disconnected at both ends.

If you use have your equipment and computer on a computer hatch or other
type of work station, some layers of aluminum foil on the vertical and
horizontal wood
surfaces between compartments may help.

Good luck!

I've tried several 900 meg units. The V-Tech units, AT&T Digital
Units, (which strangly resemble the Tropez digitals... hmmm.) Uniden,
as well as the afore mentioned Tropez all had the same symptoms you
described. I think Walley World was getting tired of me as I kept
returning each one because of the inferior sound quality. The best
one I have found so far, (which has good audio, but still a slight
echo) is the Bellsouth 900 Mhz Digital Spread Sprectum unit. It
retails for around $189.00 I believe.

See Ya!

We use Uniden Model EXP900 where I work. We've got three of them. They are 40 channels, voice scrambled, blah, blah, blah. They work great. Even when all three of us are in the same room there is no interference. They have a least 1/4" range here in the factory where we use them. They seem to be workhorses. I saw an ad in one of the papers last weekend for this model for about $150.

Hi Jerry-

I have had a PRO-62 for about 2 years now and am happy with it. I previously returned two different scanners to Radio Shack because there was too much harmonic interferance - the local trunk system was continually being "jammed" by cellular phone calls (I know some people would like this, but it was a pain when trying to hear the police). I have not had this problem with the PRO-62. Sensitivity is also good. I would, however, recommend that you get a "real" antenna (around $10 at Radio Shack) to replace the stub that comes with the radio. Particularly for VHF operation.

We have a 25-channel trunked system where I live, so I've pretty much given up on listening to the police, etc. There are just too many conversations going on at one time to follow. However, I have used the scanner to monitor many other systems, including low power (I pick up fast food almost a mile away with the "real" antenna and a "ground plane" consisting of about 5 feet of wire hanging from the outside of the antenna connector).

Good luck, and happy listening!

All the people in this group do what the Martins did, except turn the tape over to someone. I don';t mind what they did. People who use cell and home portables for serious matters are just fools. I use mine all the time, but I don't say anything serious on it. Besides, the legislature and FCC can't really make the rules regarding scanning any more rigorous and exacting than they already are.

The cheapest solution to your problem is probably to buy an amplified speaker to attach to your receiver. Then place your receiver in another room (where it will pick up the signal from the transmitter) and run the wire to the speaker in your computer room. You may have to add a jack to the receiver to plug the speaker in. This solves your problem with no modifications to the transmitter and is perfectly legal. Also, the cost of a new amplified speaker, the wire, and the jack is less than $15.00.

If you like this option, E-mail me and I will be glad to tell you how to do it. It will not interfere with the normal operation of the receiver. The problem is probably interference from your computer or power lines nearby. Most baby monitors will work very well at a range of 50-75 yards. I have the same problem with a wireless intercom in my computer room. Just moving it to the other side of the room solved my problem. Computers are real nasty to any receivers that are placed close to them...

Your comment about not being concerned with eavesdropping concerns me. A person with a good scanner and an outside antenna mounted with some elevation, can listen to your baby monitor from a range of 1-2 miles with no problems at all. It's nothing that you should lose sleep over, but something that I think you should be aware of.

I am a hobby scannist and my ICR10 is just fine.
I don't miss much despite the 6-8 channels p/second scan rate.
Some times I wonder if the super speed receivers pass over some of the
weaker signals.
I also wonder how many channels some of the critics are monitoring at
any given time.
I do own faster scanners but find myself using the 10 most of the
time.
No...I have vever used an 8000.

The static that you hear is coming from that computer of you....
So all you need to do is switch it off...but that is not what you want...
so you have to get used to the static or put in an intercom.

What I think you are suggesting is that the modified radio might
still operate within the specifications needed to qualify for
acceptance after it was modified. That is probably true but it is
also irrelevant. As Bill said, it is illegal to operate the device
after modifying it in any way, even after making an internal change
which deliberately *reduces* the output power.

A few areas of Michigan are running it now. My area is supposed to be
on it by 1 APR 97, and full operational capability should occur sometime
in 1999 (they claim...). 22 out of the planned 181 400' tall towers
have been constructed so far. The system will be Motorola's ASTRO, but
my understanding is that they'll still use the analog mobile repeater
(aka 'extender') link of 154.695.

The system has costed/will cost $187 million, and of course the state
police & state bureaucrats are either lying or showing their negligence
by spreading a lot of misinformation/disinformation/hogwash in their
public praises for this new network...

Greetings to all on this news group.

I have an opportunity to aquire a PRO-2032. Problem is the seller is
not shure how much he should ask for it. I was wondering if anyone out
there in scannerland, might have an idea what the radio is worth. It
has all the documentation, and it is functional. If someone out ther
knows what it is worth Please post it here or
e-mail me at: sirtom1@ix.netcom.com

Any help will be greatly appreciated.

Even a "salesdroid" (whatever that is) knows that when you bulls**t a customer to get a sale, what you end up with is a refund, and your commission is a big, fat zero. Doesn't do much for your repeat business either.

One night on a road trip we pulled into McD's. Had the intercom line / order window freqs going, natch, as we hit the drive through. In front of us is a car of 4 hispanic males. They place their order. Next, we hear the pimply faced cracker behind the window telling his co-worker how he's going to screw up their order, and then tells his pal how he's giving the "spicks" small fries instead of the large they paid for.

Well, my wife is half spanish and she goes through the roof. When we pull up at the window my driver (an off duty police officer) asks to speak with the manager. Pimples looks sad. My buddy explains to the manager that we've been listening to the order window and quotes to him what we heard.

The manager goes nuts; "God damnit! I've told those kids and told those kids a million times that people can hear what they are saying from a mile away, and as for the short changing and the racial slurs, don't worry, I'll take care of it". Manager grabs pimples by the scruff of the neck, last seen heading towards the managers office as we speed off into the cool air of another Illinois night, munching our fries and snickering...

Happy Scanning

These are getting more and more scarce, especially now that our
Congressional "representatives" are getting ready to further erode our
monitoring rights. Only saw one at the Orlando Hamfest this past weekend,
$400, and it was gone by Saturday afternoon.

Grab this one, if it's not gone already.

You mean that the headset frequencies are not required? I had been given the impression by others that to hear the staff talking to each other that you wouldn't hear them on the customer's frequency although you hear both sides when the customer places the order. Now I'm confused. Please clarify.
>
>The Squelch on the drive-up speaker will only open when the
>external CTCSS tone is used.

But you forgot to mention what the other person asked.... the PL tones (CTCSS) dont' usually need to be worried about at a monitor's level as it doesn't really affect whether or not you'll hear something. You'll hear it all- it's they who will only hear what's directed to them ("they"meaning those using the radio system). Difference being the OPP (Ontario Provincial Police)- their guard tone is very annoying but still doesn't interfere with listening.

"Registered Scanner Operator" is usually some fool who has paid money
to CRC Research Ltd to buy a semi-official looking certificate. They
are issued with a "licence" number that is sort of sounds like a ham
licence number. The certicates are bogus, their only real purpose is
to use as wallpaper! It only looks like it may be authentic

This has been covered at least 3 or 4 times in the past year on this forum, so it is in the newsgroup database.

Try going to DejaNews or AltaVista and search this forum for references to AR1000 or AR-1000 or AR-1000XLT and you will find the information you seek.

Maybe you can unblock the 800 MHz part of the band by changing the
range in one of the edit modes. Worth a second look.

Question: What 'misinformation/disinformation/hogwash' are they
'spreading' ??

And how can someone who's not familiar with the infrastructure &
technology details critique it with any credibility ? If the critic were
a system design engineer being cautious about, say 'frame sync' lengths,
IMBE flash upgrade paths, or DIU/wireline/T-1 level issues, then the
comments would be more authoritative and carry some weight. As it is,
disgruntled scanner listeners are hardly qualified to judge the merits
of the technology - especially since they won't be able to monitor it
after it's online.

2841. The CTIA speaks

Newsgroup: rec.radio.scanner
Date: 1997-02-21 00:00:00 UTC
From: Jon Van Allen <yonnie@worldnet.att.net>
Message-ID: <5el9sg$mf5@mtinsc04.worldnet.att.net>
Source record: 206438

Well gang, the mighty CTIA has spoken. After numerous - shall we say, frank conversations with them, spokesman Tim Ayers had this to say about future attempts to limit scanner frequencies:

Quote "We support enforcement of the existing law and proposed hardening of scanner components" Unquote. This would be application of an expoxy type material on certain circuit components to prevent modification.

I asked specifically about the CTIA's position of the reception of images, stating that with so many different IF schemes, trying to prevent each from receiving images is impossible without cutting out huge chunks of frequencies, the CTIA said there is no plans on their part to address this issue beyond the current laws already on the books.

He refused to acknowledge or address the slanderous statements by CTIA head honcho Tom Wheeler to Congress when he called scanner listeners "electronic stalkers" and scanners "sinister devices".

I also asked if the CTIA supports widely reported notions that they favor a ban on all scanners. Ayers response was they do not, that their only concern was to enforce current laws concerning telephone privacy. Does the CTIA speak with forked tongue?

Next project: Get some answers out of the FCC, and ultimately (with the chance of an icecube in hell), answers from Markey and Tauzin.

Happy scanning y'all,

Jon

>for us to be able to conduct such business on a personal level.
>

From the ARRL 10th edition of the FCC Rule Book page 7-5. "Calls to place an order for a commercial product may be made, but not calls to one's office to receive or to leave business messages."

This is not the actual wording of the regulation but is the ARRL's interpretation of the regulations regarding autopatches. If you substitute "pizza" for "commercial product", as far as I know the pizzas we are talking about in this thread are commercial products, the ARRL is saying the current regulations allow the, now infamous, call to your local pizza parlor to order your favorite pizza.

I agree with the ARRL's interpretation that it is allowable under the current regulations to place such a call but that doesn't mean you should make the call. The repeater owner has every right to place stricter limitations on the use of their equipment than what the FCC allows. Our club has indicated that even though such calls are legal they won't be allowed on any of our repeaters. But on the other hand if the repeater owner allows it, go ahead order that pizza (don't forget the anchovies on mine) no one will be breaking any rules and you won't be putting your license in jeopardy.

...delete...

Pack your scanner in your handheld luggage, and when you get on board the aircraft, grab a copy of the airline's inflight magazine from the seat pocket in front of you. Somewhere you will find a list of what portable electronic devices are acceptable and what are not. Most airlines do NOT allow scanners. Delta does, however. It says so right in the book (SKY magazine). Actually, it says "vhf scanner receivers". The most you are likely to pick up on one is the transmissions from the aircraft, unless you're holding the antenna against a window. Remember, you in a large metal tube up there with very few holes. If you're in a window seat, it's much better, but still not great.

By the way, on several flight's I have been told to put that "thing away", as it's not permitted. When I asked if the rules changed since the magazine was published, the answer is always, "well, if it's in there, then it's okay". Often the flight attendant will ask to be shown where scanners are explicitly permitted in the magazine, but that's the most resistance I have ever gotten. Of course, I always tell them that if it's a problem, I will gladly not use it, but it IS in the list of acceptable equipment in the book (just as acceptable as portable computers, which are EVERYWHERE). Again, this is just Delta. Many other airlines will not allow it.

Also, I wouldn't try pushing my luck like using a 2m HT even to just listen on with it's (often) better receiver than my scanner. My Pro-43 says "Scanner" right on the case, and that helps.

As far as whether or not it will cause interference, I don't know. Scanners will produce RF noise, but so do many portable computers.

Thanks very much! I'll check that out.

>The sections refer to wiretapping and wiretapping equipment, not scanners

That may not be true. The person who originally made reference to
those sections also cited a 1975 court case where police receivers
were evaluated and excluded because the police should be aware that
scanners exist, not because they are not "wiretap" devices.

When I get done looking at the actual text, I'll update my website
with whatever info is available.

This interpretation is interesting. Locally, the repeater groups explained to their members that, while making such calls has been ruled as perfectly legal, repeater owners still have the right to decide what uses are appropriate for THEIR autopatches. Consequently, it violates the policies of several repeater clubs to order pizzas or engage in similar activities. There is no "emergency use" test required by law. All that is needed is a decision by the repeater owner/trustee. As long as club or individual policy is at least as strict as the regulations, it's OK.

Yes, it can. I have a T41A which is the 440 version. It's done by powering
on with certain keys pressed (ie, it's all in software). Unfortuneately, I do
not remember the keys right now. The Icom section of the ham forum on
Compuserve has the info. After you do the procedure, the radio can be set to
receive any frequency, but it only works over certain ranges where the front
end lets enough signal in to be useful.

I if remember right, the grey wire was intended to silence the scanner if you have a two-way radio to prevent feedback on transmit.

An Open Letter to Craig Stoltz of the Washington Times;

How easily you paint a scannist as a "shameful waste of human potential." As a member of the media, which serves the purpose of finding out and reporting what's going on in a community--be it national, regional, or local--I'm shocked that you puke all over a group of people that merely want to find out for themselves what you guys try to find and report daily.

Find me a newsroom in any town that doesn't have an entire bank of scanners watching fire, police, and public service frequencies. I guess you would confirm a point I've been trying to make for a long time...that news editors and reporters are shameful wastes of human potential.

Can't blame it all on him. It takes the Pres and both houses to chip away at our rights. Why does everyone insist on re-electing these jackasses or the same parties? How about giving other parties a chance. We're not going to see change unless we support people who are bold enough to stray from the normal partylines.

I had a lot more respect for freebanders 10 years ago. Now when I listen down there all I hear is a bunch of 'kids' with their noise toys doing what they do on the regular channels. Freeband was the place to go to get away from the madness on the crowded channels and have real decent chats, time have changed.

Fire Rescue Offers Citizenï¿½s Fire Academy

Palm Beach County Fire-Rescue will be commencing its first Citizenï¿½s Fire Academy in March/April 1997.

The Citizenï¿½s Fire Academy provides County residents with the opportunity to accompany rescue workers as an observer after first learning what the job of a firefighter/paramedic is all about. Additionally, participants are given the opportunity to take part in home safety surveys, fire extinguisher training, Cardio-Pulmonary Resuscitation, first aid instruction, and ultimately feel the experience and the heat of a controlled live structure fire demonstration. The Academy is open to residents 18 and over. The class is tentatively scheduled to meet one evening per week for 9 weeks.

For applications or for further information, please contact Battalion Chief Steve Jerauld at the Palm Beach County Fire-Rescue Training and Safety Division located at 50 South Military Trail, Suite 200A, West Palm Beach, FL 33415 or call (561) 233-0010.

JS> would those who insist on the right to monitor cell freqs view the
JS> tapping of their hard-wired telephone lines?

You obviously don't have the brains to recognize the difference
between cellular and landline phones. Cellular uses radiowaves
which the U.S. Supreme Court in the 1940's decided is "public".
Anyone using cellular has no more right to be free of eavesdropping
as one chatting on a street corner or in a cafe.

2875. scanner advice needed

Newsgroup: rec.radio.scanner
Date: 1997-02-21 00:00:00 UTC
From: failure <man@intercall.com>
Message-ID: <330E6C30.5A73FF81@intercall.com>
Source record: 206472

To everyone in this newsgroup,
Hi. I'm looking into buying a scanner because I think it would be fun to get into radio. I'm seriously looking at the Bearcat 9000xlt(base) and 3000xlt(handheld). Im not sure exactly what I want to do with a scanner...I figure both would be fun in certain ways, yet I can only get one. This has become a small problem for me becuase I don't know which one to get...Also, whats the approximate range of the 3000xlt? Also, even though I'm not heavily interested in this, can the 3000xlt or 9000xlt decode pagers and can the 3000xlt be modified to get cell phones? Also, is CTCSS decoding used alot? I vaguely know what it is, and this can be an influincing factor if I plan on using it, since the 9000xlt can decode CTCSS tones (with an add on board) and the 3000xlt can not. I would appreciate the personal opinion of as many people as possible wether to get a handheld or base. I dont know what the advantages of base would be besides long range (they both have the same frequency range), and the advantage of the handheld is obvious.
Thanks for the help, I appreciate it.

Source record: 206476

In article <5ehvrj$4jo@news2.his.com>, Larry Van Horn <larry@grove.net> wrote:
>I'm sorry on this one folks, but I just couldn't let this one sit in
>my in basket. I'm sure Mr. Stoltz is lonely out there and really needs
>some of us to break up his lonely life with the joy of responsive and
>though provoking email via the internet.

I don't know, Larry. Looking at the article, I almost see it as
favorable to the hobby in some aspects. I suggest you show this
article to ten scanner-virgins, have them read it and then ask
them their impression of the article. It is my opinion that possibly
half of those ten will be more interested in scanning after reading the
article.

>==========Begin Washington Post Article==========
>
>Scan You Dig It?
>By Craig Stoltz
>
>If you thought America Online chat rooms were a shameful waste of
>human potential, just think about the folks who monitor the public
>airwaves with radio spectrum scanners. There may be as many as 20
>million of them in the U.S.--more than say, regularly navigate the
>World Wide Web.

Definately not favorable at first glance, but upon going back to
it, it is kind of a "Face it readers, the world is full of these
scanner listeners."

Since he starts out with this statement, and mentions the size of
the scanning population as well, many intelligent readers IMO are going
to read it with a "Shit! That many? How can a law control them all?"

>Take, for instance, that Florida couple, the Martins, who (somehow!)
>intercepted and (somehow!) tape recorded a revealing cellular phone
>conversation among Newt Gingrich and fellow Republicans, Others will
>divine whether the Martins were lucky hobbyists or party stooges. But
>I'm curious about people like the Martins, folks who apparently choose
>to entertain themselves by listening to the hellscratch of human voice
>bouncing across the radio spectrum.

Dunno about you, but the "hellscratch of human voice bouncing across
the radio spectrum", besides letting the fools know that it is bouncing
around everywhere, also rings of a bit of nostalgia... what reader isn't
going to remember stories about Granpa John trying to tune in the shortwave
radio after dinner?

>According to Bob Grove, publisher of Monitoring Times magazine and
>source of the 10-to-20-million-scanner estimate, "In some parts of the
>country, like around here [mountainous Brasstown, NC], it's hard to
>find a household that doesn't have at least one scanner, maybe two or
>three."

While the "source of the 10-20 million" appears to be a "so you might not
want to believe it" kind of statement...

>Unfortunately, a firmer number proves harder to lock onto than a
>Gingrich 411 call. Neither Uniden, the biggest U.S. scanner supplier,
>nor Radio Shack, the largest retailer, reveal sales figures. An
>industry insider, declining to cite a source, says 1 million scanners
>were sold in 1995.

.. the 1 million in 95 does add credibility to Grove's statement, and
while the writer mentions no souce for the cite, it is independent of
Grove's figure.

>Norm Schrein, president of the 12,000 member
>National Bearcat Radio Club, cites an early 80s estimate placing a
>scanner in 7 percent of U.S. households; applying that figure to
>today's population assumes 8 million scanners. Grove's company
>maintains a national mailing list of 100,000 scanner enthusiasts.

"7 percent of US housholds" is a rather impressive figure. Isn't
that about the same percentage John Anderson received in votes back
when he ran against Carter and Reagan?... a level which told the
two mainstream parties that there might really be something to a
third party battle?

>The better question is why anybody uses one. Schrein says 90 percent
>of first-timers use a scanner to monitor "their neighborhoods--police
>and fire, taxicabs, utility companies" and so on. (See Radio Shack
>catalog pitch at left). We're talking a very high noise-to-signal
>ratio here, with many transmissions of numbing mundanity. "Most people
>say they learn things they can't get anywhere else, like where
>burglaries are, where drug traffic is, that sort of thing."

Now here it seems to make out the hobby as king of bland and boring,
BUT:

>Around 10 percent of entry level users become true scanner
>enthusiasts, Shrein says, upgrading to more powerful devices, trading
>lists of frequencies (hospital, aviation, military and business codes
>appear in books, magazines and on the internet)

Here it points out like a "POT OF GOLD BURIED HERE" flag, that there is
a lot more stuff out on the airwaves too... but he does keep it separate
from:

>and, sometimes,
>graduating to the shady art of picking up cellular calls.

Which is something to his credit... he doesn't lump all scanner listeners into a single group. While he points to scanning as a dull and boring hobby, he himself points out its variety.

>Since 1994
>it's been illegal to make or sell scanners that can, or can be easily
>modified to, pick up calls on 869-894 MHz sliver of the radio spectrum
>where cellular calls ride. But used pre-'94 models are always for
>sale, and some full-spectrum units arrive from overseas. Several
>businesses, including one run by Grove, will perform a "full-frequency
>restore" to newer units for a fee. But, in fact, most new scanners
>pick up cell phone calls anyway due to technical factors Tandy Corp.
>calls "transmission phenomena." In other words, if you want to listen
>to cell calls, it's easy. Any if you don't, you'll probably hear some
>anyway.

<idiot_reader_mode>
Hmmm, well, lets see... if there were 1 million scanners sold in 95, and lets assume another million in 96, and 1 million in 94 too, that is 3 million which can't "legally" pick up cellular calls. Hmmm, but if there are between 8 and 20 million scanners total, does that mean there are between 5 and 17 million scanners which CAN legally pick up cellular phones?.. and even those others can too?
</idiot_reader_mode>

Most of us know that the above theoretical reader's thoughts are full of errors. Half of those scanners don't even go above 500mhz... but I think it clearly points out to the reader that it is hopeless to try to shut the barn door after the horses get out.

>Schrein, who lives near Wright-Patterson Air Force Base outside
>Dayton, Ohio, says he's picked up some interesting stuff from the
>legit frequencies. When the Bosnian peace accords took place in
>Dayton, Schrein was able to monitor base security frequencies to learn
>that Serb leader Slobodan Milosevic "was going into town to buy
>shoes." Of course, such memorable highlights come at a price of
>constant monitoring of daily false fire alarms, utility truck
>maneuverings and god knows how many
>honey-will-you-bring-home-a-loaf-of-bread cell calls.

Now this has got to trigger a few minds into thinking that there might be something interesting in the hobby... and it isn't that much BS either... just think... how many bread and milk calls did the Martin's have to listen to before they heard Newt?

>"Actually, I'm getting a little tired of it," Schrein confesses. "You
>can get kind of burned out."

This is kind of lame... that's why there's the on/OFF switch on the scanner...

>==========End of Article==========

I don't think anyone on this newsgroup is really qualified to evaluate the article though... I'd suggest trying it out on ten business executives, ten housewives/husbands, and ten of some other social caste, and see if it really is all that disfavorable to the hobby.

If I had to guess, I'd figure that 5 of the business executives would be swayed into thinking it's hopeless to try to regulate scanner monitoring... 7 of the house-spouses would be interested in the hobby, and on the other group... depends upon what group you chose, but I'd guess that whatever group it is, even if the majority might thing that scanner listeners might be geeks, they would find it rather difficult to see how legislation could protect their cellular calls.

Does anyone know if this two meter can be modified to extend the Rx frequencies from 25-999 mhz continuous? If so, how can this be accomplished? Is there anyone in the southern California area who possesses the technical knowledge and would be willing to perform this operation (in discreet fashion of course). My main goal is to have a radio which can monitor all police and fire bands in my area as well as Tx on the amateur band because I travel alone on the highway for extended periods and such a unit would be useful in case of emergency.

FYI: Since the out-of-band mod requires soldering skills in addition to
getting to the magic diode (on/off switch, antenna and ground strap)
and generally more care than a 2004 mod, you might want to price the
radio between $25 and $50 more than an un-modded pro-34.

..Then again, know your buyer... I wouldn't pay $25 more for a modded
pro-34, and many techies might not either, but someone not wanting to
trust their skills might find the $50 more a bargain. (BTW: Personnaly,
I would find the $50 more, repulsive.)

Hi All!
I finally got my POCSAG/MDT interface made, and am having a blast with pagers, but find my MDT searches lacking. I know my interface works (sufficiently) because PD-202 works. The only MDT I can find is the ARDIS (?) nationwide one, and it is kinda fuzzy. I get a constantly repeated string (with just a few differences) and only have gotten 1 actual message. So, can someone help me out with some MDT frequencies for the Raleigh, NC area, or tell me there aren't any.
Also, "Bob" who was talking to me about this stuff, PLEASE drop me a line... I lost your address (sorry!).

Sincerely,
Robert McIntyre

Hi Len,

Higher is better. I think radio shack sells a cell phone adapter
to put a outside antenna on handheld phone, then use a 900-930 Mhz
antenna on top of ur house...
I also have 900 Mhz phone, my is SS type though. I get 2 or 3 block

range, this is enuff for me...

The only thing I remember about the Commission's "clarification" was
that it wasn't all that clear. They were clear about the intent - they
wanted to allow amateur to conduct business communications in the
course of providing public service.

You are still prohibited from communication in which you have a
pecuniary interest. A pecuniary interest does not not necessarily mean
a monetary gain - but rather a monetary interest.

If you are trading your money for goods or services, you have a
pecuniary interest in that transaction. I tend to agree that the "pizza
order" is prefectly allowable if you are ordering it for a public
service event, emergency, etc. But I still wonder if the FCC intended
for us to be able to conduct such business on a personal level.

> supposedly 300 freq./sec. w/ turbo...
> how is a frequency defined for these claims?

Your figures seems incorrect. I just did the same test
on my BC3000:

26-27 MHz in 5 KHz steps equals 200 steps in total (1MHz/5KHz).
On my BC3000 it takes approx. 2 seconds to scan this without turbo
making the speed = 200/2 = 100 ch/sec.

With turbo on I tried scanning a 10 MHz band = 2000 steps.
Result: Time taken = 6.8 seconds: Speed 2000/6.8 = 294 ch/sec.

From what I heard via the radio dispatch operator
the guy with the scanner was registered with the police Dept and
would rag on anyone that he deemed was breaking the law!!!
She(dispatcher) had his name in "the book". It was the first time i
had ever heard of the term "registered scanner"

2895. Stereo signal and subcarriers

Newsgroup: rec.radio.scanner
Date: 1997-02-21 00:00:00 UTC
From: Rene Hagen <hagenr@involve.nl>
Message-ID: <01bc1fe0$48ad8d00$049a099a@vianen1.worldonline.nl>
Source record: 206492

I know nothing about scanners so excuses me if this is a 'dumb' question.

I know that a scanner can receive normal fm radio. I suppose it will pick up the mono signal that is modulated 20-15k Hz on the carrier (88-108 Mhz). What about the signals above 15hz? Can it receive the stereo signal (23k-53k Hz)? Can it receive the RDS signal (57 kHz) or any subcarrier information beyond that?

I assume that a normal stereo receiver is moving the stereo channels to audible range, thus 23k-38k->200-15k left channel and 38k-53k->200-15k right channel. Is it possible for a scanner to move these frequencies in audible range? If yes how about moving the 57k signal somewhere between 200-15k?

I am interested in decoding the RDS and want to know if it is possible to get the 57 kHz carrier without modifying the scanner.

Giovanni,
Thanks for the nice write-up! I should be receiving an R10 sometime
next
week and look forward to seeing how usable it is in the real world! Good
luck
with yours and I look forward to any other details you care to share.

Source record: 206495

Let's start by taking a look at the prices for these two radios.
The Pro-26 can be gotten for under $350 delivered to your door. The
Pro-60 will probably run you $340 or so unless you get it on sale
at Radio Shack for $300 + tax.
For all that the 26 does, it is, IMHO, a better value if you
are spending this amount of money for a radio. You get nearly
continuous coverage over a wider frequency range, auto-store and
search-skip along with a better display, better backlight, an
attenuator and runs on 4 AAs vs. 6. It also scans faster, searches
must faster and has pre-programmed weather frequencies.
If you are considering the Pro-26, you should probably take a
look at the BC3000XLT if you have not already done so.
Good luck!

Steve@swssec.com (Steve Uhrig) quoted himself and added nothing: <Grr>

From what I have heard they are going (scanning) very slowly.
Why is it that manufactures produce up market scanners that have one or more
flaws in them. Nobody wants a scanner that can only scan 6 channels a second
or has a measly 100 channels.

>I be able to receive anything in or outside of the plane?

FAR 91.21: PORTABLE ELECTRONIC DEVICES

(a) Except as provided in paragraph (b) of this section, no person may
operate, nor may any operator or pilot in command of an aircraft allow
the operation of, any portable electronic device on any of the
following U.S.-registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating
certificate or an operating certificate; or
(2) Any other aircraft while it is operated under IFR.

(b)Paragraph (a) of this section does not apply to--
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of
the aircraft has determined will not cause interference with the
navigation or communication system of the aircraft on which it is to
be used.

(c) In the case of an aircraft operator by a holder of an air carrier
operating certificate or an operating certificate, the determination
required by paragraph (b) (5) of this section shall be made by that
operator of the of the aircraft on which the particular device is to
be used. In the case of other aircraft, the determination may be made
by the pilot-in-command or other operator of the aircraft.

Basically what all this says is that you will need permission from the
airline authorities (Even the pilot of the aircraft may not be able to
give you that permission) to use your scanner in flight on board a
commercial airliner.

On the other hand, if you're flying a small airplane like mine, you
may use what ever you want at the discretion of the pilot in command.

FYI, aircraft navigation instrument technology mostly dates back to
the 40's and 50's. It hasn't changed much since. It has only been in
the last year or so that the FAA allowed us to use GPS receivers for
instrument approaches. What this means is that it is VERY sensitive

to extraneous radiation from things like the microprocessor and the Local Oscillator of your radio. The FAA has taken a reasonable stance and said that unless you've asked the pilot or airline for permission, it's prohibited. Why risk lives while riding an autopilot coupled approach in to 0-0 weather, just so some passenger can get a few more minutes at his laptop computer?

> that the 10 is excellent value.
> Brian

Brian,
I recently wrote an artichle about my evaluations on Icom IC-R10. My conclusion sounds like this: good radio poorly organized.
I'm disappointed because, with a very little effort, Icom could have given to me, and to you, a very nice scanner. The CPU hardware seems adequate for the job, but unfortunately the firmware programmer was not.

One more thing about EASY search channels: they are programmed exactly the same way the other 20 search channels are (name, edges, mode, step and delay). Their use is actually "easier", because you can select one out of ten by a single keystroke. But what I find useful in EASY channels is that you can halt and restart the search from the last point by the SCAN key. You can never do the same by the normal search channels (00-19), because the second pressing of SCAN key will initiate a full-band search.

Ciao, Giovanni.

Message-ID: <5ejsgm$l30@pan.otol.fi>
Source record: 206518

Does anybody know what are programmable things in
ubc 3000 xlt scanner. There is at least tree different
ways...

1. run test 1 (press shift+1 and turn power on)
press hold and limit and turn power on
--> to the display will came hi/lo/ u upsidedown and numbers
you can change hi/lo with pressing search
if there is u in display the range of numbers is 0...255
and with hi or lo range is 0.0?? .... 5 or something

2. run test 2 (press shift+2 and turn power on)
press hold and limit and turn power on
--> to display rd and hexdesimal numbers
rd (read?) can be changed to edt (edit?) with pressing delay
with hold and limit you can search/change those values

3. run test 4 (press shift+4 and turn power on)
press hold and limit and turn power on
--> to the display will came only hi/lo and numbers
you can change hi/lo with pressing search

has anyone any information about these funktions?
where do they affect or what they do?

Richard, I agree 100% with you. The Pro-2045 is my first base unit,
and I've enjoyed it tremendously. I'm considering taking with me when
I have to go on extended TDY instead of my hand-held.

Owen

When I had a rooftop scanner antenna, I used to pick up cordless phones from all over the place. I used to hear dozens of signals. It's amazing how far a few milliwatts will go when you have a good receiver.

Getting back to his problem, maybe his best bet is to install an outdoor antenna. While it's illegal to modify the transmitter, it should not be illegal to modify the receiver. If he made a simple 1/4 wave antenna and got it away from the interference from his computer, then it should work well.

If his receiver is one of those poratble types with a telescoping whip, he could put an alligator clip on the end of the coax that leads to an external antenna. Heck, he could even put a length of, wire for an antenna, right outside the baby's window and run a length of coax back to his computer room! That should certainly cure the problem.

I've been recently using a Motorola "Advisor Gold" pager, and while fiddling with it one evening, I managed to get it into a 'test mode' where it displayed operating parameters and then, as I pushed buttons, exercised the graphic display and the noise maker.

But try as I might, I can't seem to repeat the key sequence that started the whole thing off. Does anyone out there know the secret?

==========

THE CANADIAN FEDERAL CRIMINAL CODE AS OF 1997

I am only quoting sections 184 and 191 in full, if you want the full story go
to
your local library and ask for the 1997 edition of Martins Annual Criminal
Code.

Section 184 (1) Everyone who, by means of any electro-magnetic,
acoustic, mechanical or other device, wilfully intercepts a private
communication is guilty of an indictable offence and liable to imprisonment
for a term not exceeding five years.
<subsection (2) lists exceptions which are for consent by the communicators,
by a peace officer with authorization, by service providers or government
spectrum management personnel in the performance of their duties>

Section 191 (1) Everyone who possesses, sells or purchases any
electromagnetic,
acoustic, mechanical or other device or any component thereof knowing that the design thereof renders it primarily useful for surreptitious interception of private communications is guilty of an indictable offence and liable to imprisonment for a term not exceeding two years.
<same exceptions as in 184>

A 1975 ruling exempted police communications on the grounds that the police are aware that the public own radio receivers which enable them to listen to police communications and are therefore not entitled to protection.

Section 193 (1) provides for a two year sentence for disclosing the content, or even the existence, of an intercepted communication.
Section 193.1 (1) specifically applies the above to radio-based telephone communications and the synopsis thereto gives cellular phones as an example of the communications protected.

Section 194.1 (1) permits a court to order payment of up to five thousand dollars as punitive damages to the person whose communications were intercepted.☐

==========
MY COMMENTS:
In the exceptions to sections 184 and 191 note spectrum management personnel - this applies to
radio not just telephone lines.
The 1975 ruling specifically addressed a case regarding interception of radio communications.
Section 193.1 (1) makes sure that it all applies to radio communications.
This law has been in effect for more than 20 years. It is just not widely known or applied.

I read an article in this group that said that a law enforcement group wants to have ALL police and local government frequencies blocked from scanners, much the same way as cellphone freqs are blocked.

You may say it can't happen, but you have to admit it will be pretty tempting to many members of Congress. They will be told that it will "solve the drug problem", or something like that.

I'm not very pleased with this news, but I can't say I'm surprised. I saw it coming ever since the passage of the ECPA.

I am a little confused also. Military aero chatter is
between 225 and 400 MHz. And the Pro-60 does cover
this band just like it's predecessor the Pro-43.

> as one chatting on a street corner or in a cafe.
>

Joe,

I started this topic to promote discussion. I raised an issue and expected to hear disagreement. I am disappointed to see this once again degenerate into name calling.

While the air waves may be public in the sense that they are not owned by private individuals but are assigned by governments (=the people, at least ideally), I am not sure that the analogy to street corner chatting is apt.

In a telephone conversation people generally think of the situation as private, not like chatting in public. I think that most people would want their conversations to be private and free from eavesdropping. Granted that cell phones are basically radios, shouldn't people have the right to private conversations? Of course, the telcos should have thought of ways to do that rather than just broadcasting without some kind of encryption.

There are restrictions on how one uses information from public safety broadcasts, which I think most people would agree are reasonable. While the air waves may be public, it is wrong for people to just decide to broadcast whatever they want wherever they want on the spectrum (or at least I think most would agree to that as well.)

I admit I have not read legislation and Supreme Court decisions, but was posing this more as an ethical issue rather than a legal issue. Perhaps I should have been more clear.

>

I just picked one up earlier in the week on impulse since RS was clearing them out for $180.

So far I like it. I would have liked to have more than one priority channel, and would like to be able to clear all locked out channels with one keystroke as I can on my BC80XLT. (The latter also has the convenient feature of warning you when you enter a duplicate frequency.)

I have had intermittent problems with NOAA weather broadcasts ending up in the middle of the RR band 161.190 mhz, a problem which apparently happens with some other triple conversion receivers like the RS 2037. It also lacks one button weather, a minor incovenience.

I do like the fact that it will take alkaline or nicad batteries, unlike many Uniden models.

There is a review of this scanner by Bob Parnass in a past issue of Monitoring Times, but I haven't read it. Somewhere else I read that he considered this a good performer. Bob is a regular contributor to the magazine and posts helpful information here in this newsgroup.

All in all I am prett happy with it, especially given the price which is 40% off list.

Jerry

Well are you looking for a scanner to sit on your desk or table beside your recliner or are you looking for a handheld to take w/ you? What all are you looking to monitor? If your going to be monitoring cell phones, then thats a major factor in your decision. I wouldn't recomend getting a new scanner without 800Mhz capability. Alot of police & fire are on 800Mhz & even if you don't use it now, if you keep up with scanning in the next few years you will need the ability. When you decide what you want, handheld or base, then we can talk models, prices, & etc.

Hello,

I'm looking for a program to decode ACARS transmission on VHF

I will use this software (shareware) with the so called hamcom modem/interface..

so if some one can help me THANKS !!!!

greetings from Ton

What for ? Because you feel your better than anyone else, and don't
have to obey the speed limits in your area ?

If I pull someone over, and they have a 'radar detector', what might
have been a simple warning (no ticket), becomes an automatic ticket.
You got money for a detector ?, then you got money to pay a fine...

'Agressive drivers' usually feel they are better than the next guy.
Never mind the fact that they're tailgating another vehicle at 70 mph...
or forcing your sister/wife/girlfriend off the road....

Best defense against speeding tickets ? .. obey the posted limits.

Good for you! This radio, IMHO, is a great deal when
you consider the receiver and features you get for the
price! Glad to hear you bought a "winner" for your first
base unit!
Happy monitoring!

> commercial airliner.
[snip]

Nice posting Jake...but don't forget FAR 91.3(a)

The pilot in command of an aircraft is directly responsbile
for, and is the FINAL[emphasis mine] authority as to, the
operation of that aircraft.

This means the pilot of your plane has the final say so.
He is bound to his compnay's guidelines/operating procedueres
and to the FAA(if flying in the US) for following FAR 91.21.
Just ask him/her...if he/she says yes, you're good to go...
if not, better luck next time.
Fly with me and we'll both be monitoring! ;-)

licensed station.

Not only that, you must have good documentation to get their attention, and even then they basically ignore you unless it's politically expedient for them. About ten or years ago, I documented comms of several businesses operating illegally in the VHF Marine band here in Utah, complete with names, addresses, and the name of the 2-Way radio shop that set up their comms. etc. and forwarded them to the FCC.

They couldn't have cared less, even after I had a conversation with the (then) Chief Engineer Marty Volkoff at the San Francisco field office, a man I knew personally! Their position was that they had bigger fish to worry about, and that they would "look into it" when they did their regular visit to Salt Lake City. Nothing was ever done.

Just last year, our GMRS group documented a guy who owns a GMRS repeater and lets anyone and everyone use his callsign on the repeater, including a body shop & towing company in direct violation of GMRS rules. The FCC's response was a big yawn and their best W.C. Fields impersonation "Go away Sonny, you bother me".

The FCC cares about what ever is politically popular at the moment, right now it's cellular violations, they care more about placating their source of funds than doing any real work for the American people. The only other things they regularly care about are auctioning off the entire radio spectrum to the highest bidder, making damn sure broadcast stations are fined for something (The FCC has always considered AM/FM/TV stations a big fat cash cow), shutting down illegal CB equipment dealers and pirate radio stations, and maybe a police frequency jammer or two gets their attention, that's about it.

Good luck getting them to do anything, especially now that they are shutting down field offices and monitoring stations left & right.

>pjheller@west.net

the 3000 programs freq's you want to include by your fingers
doing the walking over the keys....

the trunk tracker does the walking by your fingers initiating
what it will do with the input you give it and then the scanner
takes over in discriminating the various groups within that
range of freq's you did.

then you decide which group you want to listen to. The computer
and scanner are in synch and you get to hear those groups one at
a time.

in the first, the scannner is alone with what you feed it
in the sec., the scanner is deciphering what the computer has
given the scanner to listen to and then the decision
up to you which group to listen to...the scanner then
allows reception of what the computer is giving out.

bill conduit
as long as you are listening to a Motorolla system, that is.

Gee...what is your badge number? What is your name?
All this angst and no one to go with it. What keeps
you from signaturizing your post?

...the girlfriend, wife or sister ... bit...a work
of emotional art...why is it that women are supposed to
be so important when it comes to cars and those that
inpune on their right to "tuff their hair and comb
it and brush it and then do make-up restoration at
65 mph while talking to their girl friend in the seat

next to them who is geting ready to do a "pull it out and fill it up" routine...?

all this while talking on the cell phone to their friends who want to know what they are doing? Girl chat.

and these gals don't have a detector...yet

>Andy
>
>foxcat@mindspring.com
>www.mindspring.com/~foxcat

think of it like this: if the cops go after the gangs and the
murderers and guys who hang a gun or two on their body, then
the cops have to answer to their elders why they pulled their
gun and shot the bad guys because they reached for their "weapon"
allegedly on person. All sorts of paper work and hassles by the
press and mayors office and more.

See what happens when cops draw their guns: they get hassled by
those that they are out protecting for using the guns they carry.

Plus think of those times when the cops use guns which are not in
the best interest of the department...like when a crook appears to
have a gun and the cop shoots and then it turns out the alleged gun
was a water pistol....etc.

Now take Scanner Criminals.

No need to go in their houses with guns drawn or shoot them because
they turn the scanner off or try to hide them.

Now it's "statistically" better for the major and captain to go a
hunting for scanner users...the job is easier, the bullets are
rarely fired off, the press is not interested in following a
scanner bust after the first one or two they package.

Cops now can get their arrests up and the major happy and the
city sleeps better at night.

going after gangs or murderers is "dangerous" work. so they
invent a new crime: listening to a scanner deemed dangerous
to the public good"....

I don't know about he McDonald's in the US, but in Canada there are to
different PL Tones on the "mobiles". The units have two buttons
representing the tones. One tone will make the transmission come out of
the ordering station (the post) and the other is an intercom between the
girls working the window. I know of one person who overheard the two
girls on the intercom talking about, ahem, their boyfriends skill. He
couldn't resist the temptation to mention it as he picked up his food.

Nasty buggar, eh? <G>

Cheers!

Hi Bill,

When I bought mine (used) it had already had the 3-terminal regulator replaced in it. The replacement was a shitty job so I did it again (and used a higher-current regulator). A good guess is that yours has the same problem. I also had to replaced the resistor that powers the audio power amplifier. It's kinda like an on-board fuse of sorts.

It's worked like a champ since then.

Source record: 206344

The BCT3000 is a better scanner overall. In addition, it uses
triple up conversion. You must ask yourself the following:

What's more important for me, the ability to follow
trunked communications semi automatically (BCT235XLS) or
or a "better" (BCT3000) scanner?

Personally, I would wait until the Trunktracker is released and
then read the postings. Can you afford to wait between one and
two months?

Good luck!

I agree..when I run into people who have cell phones, I tell them to wath
what they say over the air..if they don't believe me, I just let themn
listen..changes their mind about cell phone privacy real fast!
but it's a phone..no, It's a radio being used as a phone!

I don't know how it can monitor trunked transmissions, don't think that is completely true.

I would suggest buying the 895xlt, it can do conventional and trunked and has an RS232 port and S-meter. CTCSS also.

Sounds like a good scanner for about 350 or under.

This is where I found them, but you may have to go up to where I broke the line. I tried the search engine and it worked via the section numbers, but I found I could just scroll through the pages until I hit section 184. This is the "official" Justice Department website. I still believe that scanners are legal in Canada, as Radio Shack et al would be violating the law by selling them. RatShack doesn't sell radar detectors, as they are illegal. I think the key is scanners can receive broadcasts intended for public hearing (like Weather, and similar items). The Code is specific about divulging what you heard, as well as using what your heard for personal gain.

If the frequency is listed as a RCC (Radio Common Carrier) it will
usually only show the RCC licence holder, and not the users. These
are shared business bands with many users, each having their own
CTCSS tone (PL tone). We used a system like it at a place I used to
work. We shared the channel with a furnace service company, a cartage
firm, and a construction firm and the local cable-TV community broadcast
production unit. So chances are the user is paying a communications
provider for use of the system. The vendor usually takes care of the FCC
licence requirements as their part of the package.

Just for fun I bought a piece of all thread and attached it to the top
of the discone for less than $3.00 just to see if it would improve the
low band side. And guess what it did. Just my 2 cents worth.

My local Radio Shack was having a clearance special on the PRO-62 for
$180. I have found it to be a good unit: 200 channel, triple conversion.
I think that it was also favorably reviewed by an expert, Bob Parnass,
in Monitoring Times.

3001. Canadian radio laws

Newsgroup: rec.radio.scanner
Date: 1997-02-22 00:00:00 UTC
From: dstark@frontiernet.net
Message-ID: <5elhir$v4c@node2.frontiernet.net>
Source record: 206381

I've spent the past few hours trying to find the elusive "Section 183" and "Section 184", plus some in the 190s, on the Canadian government's law website without much success. Apparently, it is set up so one can search on everything BUT the section number. I would already have to know the name of the law in question, or its Chapter in the Consolidated Laws, to be able to find the text of the statute. Blech!

Can someone tell me the chapter number or title of the portion of the Consolidated Statutes of Canada that deals with interception of "private communication"? Thanks.

As far as I can see, the guy was just explaining what he was willing to
trade. This
helps a would be responder to make up his/her mind about whether to
actually
respond. Is this any different than someone stating a price? I can't
understand
why people in the news group are so willing to trash someone for the
smallest
things instead of getting to the real content.

3003. FS: Two audio inversion (de)scramblers, 800Mhz Downconverter

Newsgroup: rec.radio.scanner
Date: 1997-02-22 00:00:00 UTC
From: ae826@leo.nmc.edu
Message-ID: <330e534b.0@zeus.moa.net>
Source record: 206383
Cross-posted to: rec.radio.scanner,rec.radio.swap

Reposting a message do to an email problem with my service provider:

I've done some more digging through my scanner box (you know the one with all the cable and parts and radio's and stuff....)

I recently put up for sale a scanner with 800MHz downcoverter. I got a good offer on the scanner and broke up the set so nobody purchased the downconverter. This device will allow you to receive most things in 800MHz including that bad place where we can't legally go. It works by taking the signals in 800 and downconverting them by 382 MHz and placing them in the UHF band that all scanners have. It has a Motorola male connector that will work with older scanners, or you can chop it off and put on a BNC. It works fine, but is no substitute for a good 800 scanner. I would like $50 and you pay COD shipping via USPS.

I also found a couple of projects I built a few years ago while in college.

I have 2 frequency inversion scrambler/descramblers. They both have unique personalities:

One I built to mount to one of my base scanners and connect to a 12V power supply. You need an external speaker and 12V source. There is a tuning pot that allows you to tune the correct tone to accomplish descrambling. It is built in a radio shack project box about 6 X 2 X 1" and has a Female mini plug to run a patch cord from scanner audio out to audio in on the box and another female mini plug to connect to an external speaker.

The other is for portable use. It is built into a transistor radio case about the same size as above. It has a 9V battery compartment and internal speaker. It has a miniature phono plug to go right into the audio out of your handheld. It also has a tuning pot for precise tuning of the tone.

Both units are the same circuit that I mounted in different enclosures for my two uses. Feel free to rework them, but they are in attractive enclosures.

I no longer live in the town that uses this type of scrambling on the police band, so I want to sell them to someone that can use them. I have also had luck using them on my former secure-clear phone. I took the phone back once I found out how secure it really was!

They can be used as a pair to encode one side of a conversation on one end and decode on the other end of an audio link (telephone, radio, direct wire etc.). The decoded voice is not the quality of the orignal, this is caused by stripping off of some of the audio bands needed to accomplish encoding.

I would like $50 for the pair or $25 each with preference going to someone that wants both. You pay shipping USPS COD (about $10 because of COD charges).

I'll pay shipping if someone takes the whole lot for $100.

Tom N8LFZ

PS: Now maybe I'll have room in my box for some new scanners!

From the FAQ "Introduction to Scanning"

[...]

How Do I Determine the Proper CTCSS or DCS Code? |

There are a few ways to determine the CTCSS or DCS code |
transmitted by a station: |

1. Use an outboard CTCSS/DCS reader which must be |
attached to the discriminator output circuitry inside |
the scanner. The reader has an LCD or LED display |
which indicates the code when a stations transmits. I |
use a CSI model CD-1 Communications Decoder Unit, an |
an excellent reader which sells new for about $200. |
(Connect Systems Inc., Ventura, CA, 800-545-1349, |
www.connectsystems.com). |
2. Many of the ScannerMaster guides, as well as scanner |
club newsletters, print the CTCSS codes used by |
transmitting stations. |
3. On some scanners equipped with the CTCSS squelch, you |
can program into memory the frequency of interest. |
Then you "tune" slowly through all the different CTCSS |
and/or DCS codes until the squelch opens and you hear |
the dispatcher talking. This is a slow process and |
the station has to keep transmitting during it. |
4. A slow, brute force method is to program the same |
frequency but a different CTCSS code into several |
channels and see where your scanner stops. |
5. In some cases, I've actually examined the walkie- |
talkies I want to monitor and found the CTCSS code |
printed on a label on or inside the radio. |

3014. Can computer LAN cable be used as antenna cable?

Newsgroup: rec.radio.scanner
Date: 1997-02-22 00:00:00 UTC
From: Michael_Cole@hp.com
Message-ID: <5elidt$msu@hpindda.cup.hp.com>
Source record: 206394

Is it feasible to use ThinLAN coax cable as scanner antenna lead?
I have access to two types of scrapped computer-room LAN cable and
thought I'd explore the possibility of using it with my radio. Could
one of you technical radio buffs tell me if this is feasible or if
it's a dumb idea?

I tried to get specs (such as impedance) from Beldens web site,
but it wasn't available yet. Here are the markings on the cable:

Belden E P/N1701246 Belden E 89907 10base2 E109998

C&M Corp CL2 20AWG 75C

In general, other than matching impedance and connectors, what
other specs are important in radio cable?

Thanks for any info.

Yup. :) I'm anti-humdrum Usenet! Tonight I saw a scam on TV
whereby I could send in my money (in 3 easy payments of just $39 each)
to get a package whereby I can sign up my friends for long distance
service, and every time they make a call their "super computers" would
monitor the usage, and I'd receive a check in the mail as a commission
for signing them up. If only TELEVISION WAS BIDIRECTIONAL COMMUNICATION!
Oh well, somebodys probably being ripped off tonight. I can't protect
the stupid, but at least I can antagonize the scam artists.....sq

(doesn't it just suck the way people think it's ok to trick others out
of their money? What's the pride or honor in that? Scammers suck....)

>Which would be considered the better of the two handhelds, Pro 26 or Pro
>60.

The Pro 26 is a better unit. It has better coverage, as well as
faster scanning. It is important to note that the the Pro 26 is made
by Uniden for RS and the Pro 60 is made by Gre for Radio Shack. I
don't particularly like the display on the pro 60. It is too small.
Buy the 26, you can get if for $360, or 405+ shipping for the Euro
version.

I can only add that as bad as crime is getting, what a waste of resources to be going after scanners.

It's like there's not better things they could be doing with our hard earned tax dollars.

How do I tap the discriminator output on this combination? And once I have a wire going from it, where do I connect it? :-)

I'm sure this is a FAQ somewhere, if someone could point me to that I'll happily read.

Many thanks,

Scott

3032. Re: Stereo signal and subcarriers

Newsgroup: rec.radio.scanner

From: grohe@galaxy.nsc.com
Message-ID: <330fcd86.11360435@139.187.185.38>
Source record: 206412

On 21 Feb 1997 10:12:03 GMT,
in the newsgroup rec.radio.scanner,
"Rene Hagen" <hagenr@involve.nl>
from Involve thoughtfully posted:

> I know that a scanner can receive normal fm radio. I suppose it will pick
> up the mono signal that is modulated 20-15k Hz on the carrier (88-108 Mhz).
> What about the signals above 15hz?

IF your scanner has "WBFM", or Wide Band FM, you should be able
to pick up the subcarriers.

If you have a "regular", or "narrowband", or "listen-to-the-cops"
scanner, the bandwidth of the receiver is *way* too narrow for FM
subcarriers. The "narrowband" cop transmissions are only +/-5KHz
deviation. The "wideband", or FM/TV broadcast is +/- 75KHz
deviation.

> Can it receive the stereo signal
> (23k-53k Hz)?

You *must* tap the audio directly from the discriminator output,
the same place used by the pager decoders. Otherwise, the
subcarriers will be attenuated by the de-emphasis network and the
scanners audio chain.

> Can it receive the RDS signal (57 kHz) or any subcarrier
> information beyond that?

Depends on the quality of the discriminator. See my comments
below.

> I assume that a normal stereo receiver is moving the stereo channels to
> audible range, thus 23k-38k->200-15k left channel and 38k-53k->200-15k
> right channel. Is it possible for a scanner to move these frequencies in
> audible range? If yes how about moving the 57k signal somewhere between
> 200-15k?

No. The scanner cannot do it by itself. You will still need an
external decoder, like an LM/NE565 or equiv PLL decoder. The
subcarrier is basically an FM signal riding on an FM signal. The
scanner only demodulates the first FM signal (baseband).

In a very big nutshell, here is how "Stereo" is sent:

Two signals are sent along with the "mono" (L+R) audio you hear.
A 19KHz "pilot" tone, and a 38 KHz subcarrier.

The subcarrier contains the "L-R" (left minus right) signal. The subcarrier is demodulated, using the 19KHz "pilot" tone as a reference, into a "L-R" audio signal (200-15K as you call it).

By stuffing the mono audio (L+R), and the demodulated subcarrier audio (L-R), into a matrix, you get the individual L and R "stereo" channels.

> I am interested in decoding the RDS and want to know if it is possible to
> get the 57 kHz carrier without modifying the scanner.

I would not use a scanner. I would use the discriminator output of a good quality FM receiver. Especially in the "debugging" phase.

As you get into the higher subcarrier frequencies, the quality of the receivers discriminator becomes important. Linearity and distortion become the important factors, as well as the bandwidth if the IF chain. The discriminator needs to be able to "cleanly" detect up to 75KHz. I doubt if *any* scanner has a "HI-FI" detector.

What happens if you use a "poor" receiver??? Your subcarrier signals will be "interrupted" during large modulation swings on the main channel, or will sound "scratchy".

Filtering out the "main channel" components (below 50KHz) is important for good subcarrier reception.

As for a decoder, check out our LMC568. It is a slightly modified version of the popular LM/NE567 tone decoder. It is meant for decoding SAP (TV) audio, but it is a simple matter to tune it for 56KHz.

http://www.national.com/pf/LM/LMC568.html

Go to this page and order a free sample. It may take about a week or so.

If you can find it, get the Philips/Signetics Application Note 184, and the *Philips* datasheet for the NE565 (AN-184 & NE565 do not seem to be on the "New and Improved" Philips site).

Ramsey also has a complete SCA kit:

http://www.ramseyelectronics.com/prod05.htm

For the final step, you can then run the output of the subcarrier demodualtor into the input of a Hammcom/POSCAG interface to talk to the computer.

Past that point, *I'm* lost! It's up to you!

Cheers,

The drive-thru systems operated like a small local repeater. The
clerks can only receive on the speaker frequency. The squelch on
the drive-up speaker will only open if the external CTCSS PL tone
is used. It should noted that the system can also operate in full
duplex mode (the customer can speak to the clerk while they are
reading their order back to them).

> still doesn't interfere with listening.

If you have CTCSS capable scanner, then you do need to worry about it,
unless you turn that feature off.

The CTCSS tones are also used as guard tone for the local repeater.

Example: CTCSS tone of 77.0 Hz is used for external comms
CTCSS tone of 123.0 Hz is used for internal comms.

This is used to screen out any near by business (like Wal-Mart)
that may be operating on the same frequency (like 154.600).

I once worked for a company called Dyncorp who was responsible for the installation of security systems at United States Information Agency facilities around the world. I installed (along with a co-worker) a security system at a location in Lesotho (small country in S. Africa) one summer for a cost to the taxpayers of $17,000. What facility do you ask? It was a library.....a library to tell the people of Lesotho how to go to the US and apply for grants and the like. The facility was dismantled 2 years later.

You're ripping on the exploration of Mars and we have an entire organization called the USIA around? Why the HELL do we need the USIA??? The Information part of that acronym is for information given to the foreigners that are interested in coming to the US to go to school here. (and get our money to do it)

It would put a lot of people out into the real world really quick, but if I were to become president, the first thing to go would be the USIA. There is a lot of worthless shit around like that. I have never even HEARD of the USIA before I worked for them.

LIBRARIES!!!!!!! LIBRARIESSSS DAMN IT!!!! Librarys that were better than my high school library!!!! By the way, what the hell is a 7000 foot airport doing in the middle of ARK??? Maybe we should ask Mr. Crook (pres) that.

Sorry this is way off topic, I'm just really pissed.

From: footage@panix.com
Message-ID: <5en0rh$gio@panix.com>
Source record: 206421

For a historical project, I'm seeking off-air recordings of public safety (and, if lucky, federal) coverage of major historical events in the 1960s and 1970s.

Some topics of special interest include:

Watts 1965, Los Angeles
Antiwar movement 1960s
CHP recordings, 1950s-1970s
Forest fires
Earthquakes in California, especially Sylmar 1971 and San Francisco 1989
SLA, San Francisco Bay Area, 1974-75
And more.

This is a privately funded project. I'll be happy to explain more about it to anyone who is interested. Confidentiality on my end is assured.

I will pay owners for access to their recordings and supply copies on digital audio tape if they require it.

With thanks,

Rick Prelinger

Good post Darrell. The same holds true for the new 800MHz
SMR trunked systems. One person will license a bunch of
frequencies, and then "lease" them to people who pay
by the month/year/whatever to use them. The only person
in the FCC license data will be Joe Brown but there may
be lots of businesses using "his" licensed frequencies
and therefor remain anonymous(up to a point that is ;-)

>>
>> The ear jack on my scanner outputs in mono-
>> would it be possible to change that to stero?

What do you want to do - have stereo audio or just to be able to plug in a stereo plug and get both sides to go?
To get proper stereo - impossible your audio will be mono.
To get both sides to go - just open up your radio and locate where the speaker/ear jack is and after buying a stereo one to replace it put the new one in making sure that you connect the left and right lugs to the existing audio supply and then you can hear (mono) sound on both sides....good luck!

3055. Trunktracker Question

Newsgroup: rec.radio.scanner
Date: 1997-02-23 00:00:00 UTC
From: Cannon Memorial Library <stlib1@tingley.net>
Message-ID: <33111A9B.6288@tingley.net>
Source record: 206185

The trunked system that I moniter has a "Beep, Beep, Beep"
type of transmission after each time one of the radios
in the group is keyed (presumably to deter scanner
users from monitoring the group). Would the new Bearcat
235XLT ingore these annoying transmissions, or will I
have to endure them still even after investing in the
Trunktracker. Secondly, the county is currently considering
implementing a "Buzz-saw" type of listener-deterent. How would
235XLT react to this??? I would especially like to hear from
anyone who has tested the 235XLT on systems such as the one in my
county......please send any responses to the newsgroup.

Thanks in advance

Hi!

How easy is it to monitor the new digital cellular phones (PrimeCo,
PCS)? Is it encrypted? Is it really more secure thatn regular
cellular? If you have a scanner that covers this range can you monitor
them? I know they have the following specs:

Frequency Range: 1850-1910 MHz transmitter
1930-1990 MHz receiver

Thanks!

Andrew

The key word is DIGITAL. Pick up your phone while looged on to the net
and monitor that!
its digital too.
Your not gonna break it.

> MikeYour not going to have a problem with importation. All you will have to do is pay US customs duties. Have it shipped overnight air and you will probably get a bill in the mail about a week later for the duty. If the radio get stopped by customs they will just hold it until you pay or they will return it to the shipper. Then they can ship it again the next day and it will probably go through with no problems. Better yet go up there and buy it and bring it back yourself. By the way the customs duty is 10% if the U.S. price when an item is manufactured in Japan.

Good Luck,

Mike

The monthly Nuts & Volts is indeed still around. I do
want to warn everyone of my experience with their subscription
department.
I phoned at the end of November and asked to start a year-long
subscription beginning with the Jan.97 issue. Around Jan 10th, I
had not received my issue in the mail yet they were plentiful
(and free) at a local surplus house that advertises heavily in it.
I picked up an issue and the following week after still not having
received my subscription issue, I phoned them. I was told the
following facts:
1. The free copies are sent to stores and hamfests by UPS first.
2. A week or two later, the subscription issues are mailed to
paying subscribers by 3rd class which delivers in 3 weeks from the
date of mailing.
3. When I pointed out that the value of the subscription is in
having it very quickly after it is printed so that one has a chance
to respond to interesting ads, I was told that they would not change
the way it was mailed nor change the delay that they add to the
subscription copies.
4. Without any reasonable alternative and still no subscription
copy delivered to me, I called again and cancelled the subscription.
I was told that I would NOT get a full refund as they had mailed one
to me. She said that even if the copy never arrived, I would still
have to pay for it. I knew that this was not ethical and VISA would
not allow them to cheat me.
I disputed the charge to my VISA card bank and they will tell
Nuts & Volts that I must be refunded.
In conclusion, don't waste your money subscribing to Nuts & Volts
unless you simply don't have another way of getting a copy and thus
do not mind that the issue you get in the mail will be a full month
after they appeared in the stores.

73s,
Jeffrey Pawlan WA6KBL

>
> Just a thought.

Well since alot of our "leaders" are into the technology age and need to conduct thier bussiness (or shady dealings) on the go, they want security. Little do they realize that cordless phones & cellular phones are simply a two way radio with a phone patch. As I understand your reason of thinking, but do not worry, the drug dealers can be monitored. Police have been monitoring the phones for years, its not illegal for them to listen in on the drug shipment, its just illegal for us to listen to Newt discuss his problems.

I have a RadioShack Pro-37 scanner for sale.
It is a duel conversion scanner with 200 channels.
It has Hyperscan for 25 channels/sec. scanning or
50 steps/sec. search. Has all standard functions
and covers 30-960 MHz. There are several mods
availible for this unit off the web.
Price is $150. plus Shipping
If you are interested drop me a line.

You're running Agent, so the cure for this nonsense is simple. Go
into Groups|Default Properties|Retrieve and set "Do not retrieve
bodies longer than (nnn) lines" to some sensible number. I use 500,
but 200 or 300 will be enough for most messages. Then, if you want to
download the message later, you can.

> a inverted 'P' on the upper display in the left corner. What dos this
> key do and why there is a inverted 'P' and a normal 'P' on the upper
> display ?

Each bank of the scanner has a priority channel. It is usually the
first channel in the bank, but you can move it if you want. The
normal 'P' tells you which channel in the bank is the priority
channel.

When you turn on priority scanning, the scanner will check the
priority channels once every time interval (about a second) for
activity, even if the scanner stopped on another non-priority
channel.

I'm not next to my unit to confirm this, but the inverted 'P'
probably means that the unit is scanning in priority mode.

3076. NSA and Pro-2035's

> thanks

That's a question I think you'll have to answer yourself. At
$200 the Pro-60 is a sweet deal. Wide coverage with AM/FM/WFM
receive. Decent audio however it needs 6 AAs and the display
and backlight are lacking.

The Pro-26 will run you another $150. In the same class is
the BC3000XLT. Is worth it to you to spend an extra $150
to get auto-store, search-skip, attenuator, extra frequency
coverage and scans/searches twice as fast?

I personally am finding it harder and harder to use a radio
that does not have search-skip(one of those things that's
hard to do without once you get use to it ;-). The auto-
store is also nice if you're heavy into finding new freqs.
But is it really worth $150? Tough call.

Without doing a direct comparision of these two radios with
respect to sensitivity and intermod rejection, I would say
they are pretty equivalent overall. Of course this doesn't
help in making a decision either. If the 26 was superior in
signal detection to the 60 then you could also help justify
the added $150...but it doesn't, so you can't.

I'm trying to find the frequencies for the wireless mics that are used in patrol cars when recording traffic stops. I know that you have to be pretty close to them to hear anything I'm sure. If anyone knows a frequency by experience, please e-mail me. Thanks!

Greg,
I do not normally pay much attention to changes in the Criminal Code, but your comment about the changes being due to interception of a political cellphone call intrigued me, since one of the related rulings on the law dates back to 1975, and I don't recall a lot of cellphones being around then.
Could you perhaps point out the changes you are referring to?
I'm just curious because I thought the law had been pretty much unchanged for at least 20 years, ever since they removed the requirement for licensing all receivers for frequencies above 136MHz, which as I recall would be in the very late 1960s.
Regards,
Dave

> Thanks for the help, I appreciate it.

Unless you can't live without
1) CTCSS decoding AND/OR
2) Tape recorder control AND/OR
3) Alpha-tagging

get the BC3000XLT. A nice solid radio that packs a lot
of features and performance into a portable listening
station. Has great sensitivity and front-end filtering.
Neither was designed to be moded to get cells although
personally, I would say don't worry about it. You can
still get them via images which will allow you to decide
if you just have to have a cell-capable receiver.

As for range, that's more a factor of the transmitter and
your antenna height which is independant of which
receiver you choose. The BC9000 will probably give you
an edge in certain ranges but I wouldn't worry about
that seeing as how this will be your first radio and
both are "proven" rigs.

I doubt you will NEED CTCSS capability. I also doubt,
you being new to monitoring, you will NEED tape recorder
capability. And along with this goes the luxury of
alpha-tagging. Starting out, you will not have soooooo
many frequencies to monitor that you will need to

alpha-tag them to remember who's who. Granted, as time goes by and your database of freqs increases, you may find this feature desirable. It might also help if you live in/near a large metropolitan which will increase the total number of frequencies that you have to monitor. I think the flexiblity of portability overrides this feature though. These are my personal opinions of course and there will be many others who will oppose me strongly.

Buy a stand for the BC3000, hook it up to an external antenna when at home and you've got yourself a pseudo-base station. Then when you go out and about or on vacation, slap on the ducky and you're ready to tune in on the exciting world around you.

Good luck!

For Sale:

Pro 62 Radio Shack handheld scanner. 200 channels, 24 ch/sec scanning speed, 50 ch/sec search speed. Individual channel delay, lockout, priority channel. Covers standard bands. Unit is in excellent condition, includes manua, rubber ducky antenna, and orginal box. Bought new 6 months ago. $160

Pro 2026 mobile/base scanner and AC adaptor. 100 channels and band search, individual channel delay, lockout, priority channel, mobile mounting bracket, manual and orginal box. Unit is in excellent condition. $150

Price includes the cost of shipping UPS ground. Please email if interested or if you want additional information.
Thanks,

Dan Schopp

Meanwhile, here's the PRO-2035 review I posted a few years ago:

The Radio Shack PRO-2035 Scanner:
How Does It Compare With the PRO-2006?

Copyright 1994 by Bob Parnass, AJ9S

[NOTES: An earlier version of this article was published
in the author's Scanner Equipment column, Monitoring Times
magazine, January 1995. This article may not be reproduced
in whole or in part on CDROMS, in bulletin boards,
networks, or publications which charge for service without
permission of the author.]

Radio Shack recently discontinued the PRO-2006,
perhaps the best base/mobile scanner radio ever sold, and
replaced it with the 1000 channel PRO-2035. Bob Grove
reviewed the PRO-2035 in October 1994 Monitoring Times
magazine. How does it stack up against the PRO-2006? Read
on.

Background

In 1986, Radio Shack introduced the PRO-2004 wide
band programmable scanner and it immediately captured the
attention of hobbyists. The PRO-2004 was made by General
Research Electronics and was different from other models of
that era due to its large 300 channel capacity and nearly
continuous frequency coverage of 25 to 1300 MHz. Key to
the PRO-2004's superior performance over such a wide
frequency range was the use of "up conversion," a design
found in expensive commercial and military receivers.
The PRO-2004 was replaced by the PRO-2005 in 1989,
which was upgraded to the PRO-2006 one year later. The
PRO-2005 and PRO-2006 were manufactured using tiny surface
mount components, and despite a different cabinet, display

panel, and keypad, the PRO-2004 and PRO-2006 circuitry and features were very similar. The PRO-2006 scanned and searched faster and was more sensitive. Except for the use of a plastic case, the PRO-2006 was equal to, or better than the PRO-2004.

By 1993, the highly prized PRO-2006 was getting long in tooth. Uniden introduced the Bearcat 8500xlt, the first Bearcat scanner featuring up conversion and a tuning knob. Radio Shack's somewhat late response to the 8500xlt is the new PRO-2035.

The PRO-2035 analyzed in this review was purchased from a local Radio Shack store and bears a serial number near 3000.

Physical

The PRO-2035 is about 5/8" wider and 1/2" taller than the PRO-2006. Extra room in the spacious cabinet will interest experimenters and companies who may provide aftermarket accessories for the PRO-2035.

The dark plastic case has rounded corners, typical of contemporary "European" stying. The squelch and volume knobs are the same dark color as the front panel, and you can't see where they are set as Radio Shack opted not to paint the hairline marker grooves a contrasting color. You can paint a white groove in each knob using a small bottle of White Out correction fluid, a product intended for covering typing mistakes.

Although there is a jack for running the PRO-2035 from a 12 VDC source, Radio Shack refers to this model as a "home scanner."

Frequency Coverage

There is a typographical error on page 3 of the owner's manual which specifies that the PR0-2035 tunes the 470 - 805.750 MHz range. Coverage in this band actually stops at 520 MHz and resumes at 760 MHz. Despite the limits cited in the manual, the PRO-2035 tested for this article tuned 25 - 520, 760 - 823.995, 849.005 - 868.995, and 894.005 - 1300 MHz.

Lately, the most frequently posed scanner question on the Internet and computer bulletin boards is, "How can I modify my scanner to cover the cellular phone range?" The FCC no longer permits companies to sell scanners which cover the 800 MHz cellular phone frequencies or which can be easily modified to cover them. As sold in the USA, the PRO-2035 does not tune the cellular frequencies directly. This raises an interesting question for a product reviewer or scanner experimenter: If he or she finds an easy way to expand frequency coverage into the cellular

phone band, should the information be published? Doing so could lead to a product recall.

Memory Features

The PRO-2006 has 400 conventional memory channels and 10 Monitor channels backed up by an ordinary 9 volt battery. The PRO-2035 has 1000 conventional memory channels and 100 Monitor channels backed up by a special 3 volt battery soldered onto the main circuit board. The owner's manual states memory contents will be retained for up to 3 months in the event of a power interruption.
Both the PRO-2006 and PRO-2035 have 10 pairs of search limits, but the PRO-2006 permitted searching only one range at a time. The PRO-2035 is more flexible and allows "linking" search ranges together sequentially. You can set search range #1 limits to 46.61 - 46.97 MHz and search range #2 to 49.61 - 49.97 MHz, for example, and the PRO-2035 will alternate searching both ranges.
Here's a tip: If your favorite search range has one or two birdies, or frequencies you want to skip, you can break the range up into two or more sequential ranges and link them together.
Not only are there a lot more channels in the PRO-2035, but several new ways to manipulate them. By pressing a few keys, you can:

1) zero all 100 memories in any single bank

2) zero all 1000 memories in all banks

3) zero all the locked out memories in any bank

4) display the number of "empty" channels in any bank. The PRO-2035 owner's manual refers to memories which contain 0.0000 as "empty" memories.

5) move all the nonempty channels in a bank downwards to fill in the empty channels in the bank

6) transfer multiple Monitor channels into one or more banks

7) transfer all the channels in any bank into the Monitor channels

With so many channels, the PRO-2035 needs another feature, but it's missing: it should skip over empty channels automatically. Although the PRO-2035 scans twice as fast as the PRO-2006, it still wastes time scanning empty channels unless they are locked out. The bulk move operations listed above clear the lockout on each destination channel. Owners will certainly grow weary of pressing the LOCKOUT and MANUAL keys for each empty channel.

There are 10 banks of 100 channels each. Bank 1 is for channels 1-100, bank 2 for 102-200, and so forth. This is more difficult to use than the numbering convention employed in the Icom R-7100, where bank 0 is for channels 0-99, bank 1 for channels 100-199, etc. With Icom's numbering system, you can easily tell what bank a channel is in by its first digit, e.g., that channel 650 is in bank 6. In the PRO-2035, channel 650 is in bank 7, and that's confusing. All that aside, a better scheme would be to have more banks and fewer channels per bank, say 50 banks of 20 channels, or even user definable banks, because a bank of 100 channels is really too large for sensible programming.

Almost 20 years ago, the Electra/Bearcat BC-250 incorporated a fantastic new feature termed "search and store." One could program a pair of frequency limits, start an automatic search, and store all active frequencies into a special scratchpad memory. The active frequencies could later be recalled and programmed into regular memory channels. Electra's scheme was elegant -- smart enough to store each active frequency once and only once. What's more, one could store unwanted frequencies, e.g., birdies and paging frequencies, into the scratchpad and they would be skipped during conventional searches. Today's Icom R-7100 receiver boasts a similar feature.

Scanner hobbyists were hoping Radio Shack would offer a search and store feature in its next premium scanner, and it did -- sort of. The PRO-2035 has an Auto Store mode which stores active frequencies found during a search into one or more conventional memory banks. Once all the empty channels are filled, the PRO-2035 emits a series of beeps and stops searching. There is a separate pair of frequency limits for Auto Store so you won't use up one of the 10 pairs mentioned earlier.

What a pity the Auto Store implementation is not all it could be. You cannot use it to skip unwanted frequencies. Worse, it will store the same frequencies over and over again into empty memory channels. Let's say you program the PRO-2035 auto store limits to search between 407 and 419 MHz, and specify that active frequencies will be stored in bank 4. You start the search and let it run while you run some errands, hoping that while you are away, the PRO-2035 will be catching dozens of interesting federal frequencies.

Upon returning, you find the PRO-2035 snared a busy Veteran's Administration hospital paging system and stored the same frequency in 30 channels! That's just what happened during the evaluation. Even with its limitations, the Auto Store mode is beneficial and a few new frequencies were found while using it.

Here's a tip not mentioned in the owner's manual --
you can use the Auto Store mode to intentionally store the
same frequency in several channels. Set both the lower and
upper auto store limits to be the same frequency, open the
squelch, and start the auto store search. The PRO-2035
will chug along, storing your favorite police or other
frequency in all the channels in the banks you selected.
The tests which follow were performed by switching
an outdoor Antenna Specialists AV-801 antenna back and
forth between a PRO-2006 and the PRO-2035.

Sensitivity

Spot checks were made to compare sensitivity by
listening to the same weak signals on both scanners. Both
radios were similarly sensitive except in three instances:
the PRO-2035 was slightly more sensitive at 147 and 852 MHz
and noticeable more sensitive at 460 MHz.
This could be splitting hairs, as my 10 year old
Electra/Bearcat BC-300, an old design optimized for 4
bands, beat both Radio Shack models in the sensitivity
department.

Dynamic Range

The PRO-2035 and PRO-2006 are high end models, and
people who buy them are more apt to connect them to outdoor
antennas. Therefore, it's important that they perform well
in strong signal environments.
Perhaps the biggest performance difference between
the PRO-2006 and our PRO-2035 became apparent when
listening to weak signals in the presence of a strong
station transmitting on another frequency. The PRO-2006
has much better dynamic range than the reviewer's PRO-2035.
Using the PRO-2035, a moderately strong signal from
the 460.525 MHz sheriff's repeater 10 miles distant wiped
out weaker signals on frequencies 50 kHz in either
direction and produced hiss on weak signals 100 kHz away.
The desense phenomenon was a problem in the 155 MHz band,
too. The PRO-2006 was not affected by these signals.
To explore the problem further, the PRO-2006 was
replaced with a PRO-2005 and the tests run again. Neither
the PRO-2005 nor PRO-2006 were desensitized by the
moderately strong signals.

Images and Spurious Responses

The PRO-2004/5/6 series, the portable PRO-43, and
the PRO-2035 use "up conversion," but the PRO-2035's
609.005 - 613.5 MHz first IF (intermediate frequency) is 2
MHz higher than the earlier models. We speculate the
change was made to avoid interference problems which

bothered some owners of the earlier scanners who lived near a channel 20 television transmitter. The TV signal mixes with one of the local oscillators and generated a third signal near 48.5 MHz, the 2nd IF, causing interference on several frequencies.
Although up conversion affords improved image rejection, triple conversion and frequency synthesis circuitry are complicated and several images were heard, especially on the PRO-2035.
On both the PRO-2006 and PRO-2035, images of paging transmitters were audible in the 159 - 162 MHz range. Analysis shows these signals to be 771.9975 MHz higher than the displayed frequency. For example, the 931.5125 MHz KOR933 paging transmitter, located more than 7 miles away, was heard when the PRO-2035 was tuned to 159.515 MHz.
A paging image hindered reception of a sheriff's repeater in the next county on 159.15 MHz. The same paging images were present but barely detectable on the PRO-2006.
Another image, heard only by the PRO-2035, appeared on 146.075 MHz, and it was actually a 904.075 MHz data transmission.
The PRO-2035 received cellular phone images, reduced in strength, between 1105 and 1115 MHz. The difference between the actual and displayed frequencies varied:

PRO-2035 tuned to frequency (Image)	Actual transmitted (Actual)	Difference (Actual - Image)
1105.550	870.450	235.100
1107.875	876.120	231.755
1110.900	881.100	229.800
1113.470	886.530	226.940
1114.840	893.160	221.680

New Features

The new tuning knob has a light feel but is a welcome feature nonetheless. A look inside the PRO-2035 revealed the tuning knob is connected to a special switch assembly rather than an optical chopper, or photo interrupter, used in higher price radios and computer mice.
The knob can be operated as a channel selector or as a VFO control. We discovered a technique, not mentioned in the owner's manual, which let's one enter a frequency and tune around without actually storing the frequency. To tune around 154.6 MHz, for example,

1) press MANUAL (if not already in the manual mode)
2) press 154.6

3) press TUNE
4) rotate the knob in either direction to begin tuning

If you have never used a scanner with a tuning knob, you will be pleasantly surprised how handy it is to be able to tune around using a knob instead of fighting with the up and down keys on the PRO-2006.
While putting the PRO-2035 through its paces, the tuning knob was used in the VFO mode to chase down and identify a spurious paging signal, a "spur," which was drifting up and down the 2 meter ham band. The spur caused a serious interference problem to three area repeaters. Chasing a wandering spur requires the use of a tuning knob and the PRO-2035 served well. The PRO-2006 was virtually useless in this application.

Other Considerations

The PRO-2035 specifications state 50 channels per second as the fastest scanning speed. Our PRO-2035 scanned slightly faster than 50 channels per second in a bank loaded entirely with 800 MHz NFM frequencies, and slowed to 40 channels per second in a bank purposely loaded with a mixture of frequencies in different bands and modes.
Some scanner buffs refuse to use the priority feature on their radios because priority sampling tends to "chop up" transmissions on nonpriority channels. The priority feature in the PRO-2035 is well behaved in this regard, and one can hardly tell it's enabled.
While the squelch on the reviewer's PRO-2035 had an acceptable amount of hysteresis, some users may wish to reduce it. That is, decrease the amount of "play" in the squelch control. One could lessen the hysteresis by replacing the tiny 100 Kohm surface mount resistor between pins 12 and 14 of IC-2, a TK10420, with a 220K or 330K ohm resistor.
Wine gets better with age. That's not true with the EL (electroluminescent) panel used to backlight the displays in the PRO-2004, PRO-2005, and PRO-2006. The EL panel grows dim as it is used. To prolong its life, GRE replaced the dimmer switch in later production PRO-2006s with a switch used to turn off the back light.
Instead of an EL panel, the new PRO-2035 utilizes LEDs (light emitting diodes) to illuminate the display, and that's an improvement. Unless overdriven, LEDs will work reliably for a very long time.

Summary

Being at the top of the Radio Shack scanner line, we expect a lot from from the PRO-2035. Its tuning knob and memory manipulation features are significant advantages

over the PRO-2006. The discontinued PRO-2006 exhibited better dynamic range and fewer images and remains an excellent performer.
The PRO-2035 is a very good scanner. With a few changes, it could be a great scanner.
After this review was written, Uniden introduced the BC9000XLT top line base model, which the author tested and prefers to the PRO-2035. See the BC9000XLT review in Monitoring Times, March 1995 for more information.

I know I might be beating a dead horse but, Can anyone tell me what kind
of interface I will need for my Pro-2005 scanner to make it work with
the Mdt.exe program? Where Can I get it or the schematics to build it?
Any help is appreciated.

169.4450
169.5050
170.2450 - most common frequency used
170.3050
171.0450
171.1050
171.8450
171.9050

I've come across several of these in Cambell, CA on 170.245 Mhz

I've heard them up to 1000 feet away!

By the 'R-10' do you mean the Opto. Interceptor? I got several e-mail
responses on the subject of using it to monitor cell calls near by but
nothing conclusive. I didn't actually correspond with anyone who
owned one and had put it through it's paces.
I am still curious since simply having a cell capable scanner is far
from the perfect set-up.

Hi Andy,

They use the same type of drive-thru system here in the US.

I think this discussion started because a few people could not understand why someone would want to listen to a Fast Food drive-thru system. I have to agree with the statement that most of what is said is very boring, however I've also come across some very interesting internal conversations.

One evening, while listening to a drive-thru waiting to place my order, a friend of mine and I heard the clerks discussing between themselves whether black or white women had better breasts. You name it, you will hear it at the drive-thru.

The real fun comes when you freak out one of the clerks by commenting on something they say about the previous customer. They start worrying that they might have said something that went out over the intercom to the customer. This has a very chilling effect on the clerks.

of course you're not supposed to listen to cell calls, but if one did, would it be worthwhile keeping a list of of frequencies for individual phones or are the frequencies assigned at random for the same phone depending on how busy the airwaves are at the moment? if yes, does such protocol vary by locale?

just wonderin',

thanx in advance; e- mail to this address.

Hey Larry .. !

This is cut out of the mdtprog.txt:

Good luck and stay in touch on this subject!
-Bob

COMPUTER/SCANNER INTERFACE

Those of you who have already built your interface for decoding
pager messages should be able to use that interface without any further
ado. For those starting from scratch - you might want to check out
packages intended for pager decoding such as PD203 and the interfaces
they describe. The following excerpt gives an example of a decoder that
should work just fine (lifted out of the PD203 POCSAG pager decoder
shareware documentation):

```
>
> 0.1 uF |\ +12v
> ---||----------------------|- \|
> AF IN | |741 \
> ---- | | /--------------------- Data Out

>

If I were building this circuit I would strongly suggest tying the
non-inverting (+) input of the op-amp to ground since you are working
directly with the discriminator output and don't need a Schmitt trigger.
All these parts or equivalents are easily available (even at your local
Radio Shack which stocks the finest collection of components that have
failed the manufacturer's quality control checks and supported by a
sales staff that's always got the wrong answers to your questions).

Also: DO NOT use the RI (ring indicator) as an input to the computer.

Well I would have to say contact a couple of radio shops & get some prices on parts & labor. I have no idea what it would cost to replace the display (providing its still available). You can contact Uniden at WWW.UNIDEN.COM , they are a pain to deal with, but they may be able to tell you if the parts are still available. As for coverage here it goes....

Low band 32 - 50 Mhz
Air band 118 - 174 Mhz
2 Meter & High Band 144 - 174 Mhz
Uhf 420 - 512 Mhz
No 800 Mhz avilable.................

1 button Air & Marine search, 40 Channels, fully programable, w/ 1 Pri Channel.

The Grove sells them for arround $60.00 to $70.00, so if your interested in an older base unit with just the basics, this would probably do.

Party Animal,

Make sure it's got a big meter and at least 10 to 20 knobs.
The more knobs, the better. My HAM's gots 15 knobs and two
meters with TWO big knobs in the middle. I can get all kinds
of stations really strong except when the sun is up.

gud ruck

Whenever a new law is enacted, there will always be people trying to see if they can bend it/break it. Noone gets caught, it's always the other guy.
Modifying scanners is illigal. However it is done everyday. Killing is illigal and is also done everyday. Remember you only get cuahgt evesdropping if you are stupid enough to repeat what you heard. Thousands of people listen in to private telephone conversations everyday. None get caught.

I had a doorbell ringer that picked up someone's cellular phone when they drove by. It was the darnest thing to hear someone talking in the foyer and no one being there. The conversation was only one-sided. I finally stood there and realized what was happening. Go figure!

Don't drive past that house while using a cellular phone, you'll be forcing a doorbell ringer to break the law! ;-)

Andy

>
> John

Nice posting John.

I will add that, since the TrunkTracker will be based on
the BC230XLT, it will still use double-conversion, compared
to the triple-conversion receiver of the BC3000XLT. This
may be a BIG difference depending on the kind of RF
activity in your area.

Someone pointed out before that if the BC235 TrunkTracker
is going to monitor the data channel, if you get intermod
interference from a cellular or paging signal nearby, I
would hate to think of what that might do to your ability
to reliably scan a trunked system...especially if you are
in the middle of "TrunkTracking" a conversation.

Cross-posted to: rec.radio.scanner,rec.radio.swap

I need to know if anyone has a Bearcat 300 schematic showing the audio output wiring configuration. Many years ago I modified one of the two audio jacks and can't decode my notes! If anyone could either make a photo copy of the section of the schematic showing BOTH audio output jacks, I will be very happy. If you want, you can fax it to me, email it etc. Even a hand drawing will work.

On the subject of the Bearcat 300, does anyone know of a way to brighten the fluorescent blue display? Maybe a voltage adjustment of some sort?

Thank You

Tom N8LFZ

3128. search for scanner with special features

Newsgroup: rec.radio.scanner

Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.scanner

Hello all,

Can anyone help locate the following "ideal" (for me...:-) scanner?:

Scanner #1
=========
1. FAST SEARCH rate (at least 100 steps/second). fast SCAN and large
amount of memory channels is not a must. Programable search steps
would be an added bonus.
2. Support for search limits (upper/lower bounds, with automatic
roll-over).
3. Receives 400-500MHz.
4. Can OUTPUT received frequency (once squelch is triggered) to
external port (preferably RS-232, but can also be CIV or any other
standard).

Scanner #2
=========
In addition, we are searching for a scanner that can INPUT a frequency
change command (preferably RS-232, but can also be CIV or any other
standard). This feature might be supported in the first scanner
described, but can also be a completely different scanner.

Any pointers to such scanners would be truely appreceated.
Since many ham radio handheld transceivers support scanner functions,
any candidate with the above features is also a candidate.

regards,
techno

(P.S: When responding, please email directly in addition to posting
here, since our news server isn't very up to date. Please note
that you must edit the reply email address (remove the .NOSPAM
postfix). This has been done in an attempt to reduce the amount
of junk mail received here from automatic mailers. Thank you.)

>Tom N8LFZ

A dim display in a BC300 will likely become a blank display soon.
Replace C98 and/or other caps in the vicinity.

From my article "REPAIR TIPS: BEARCAT SCANNER RADIOS"

[...]

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ
a switching type power supply stage to generate plus and
minus voltages in excess of 20 volts DC. When this
switcher fails to function, the display goes blank, but the
squelch control appears to work, and white noise can be
heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've
fixed, C98, a capacitor in series with the primary of the
switching transformer failed, causing the output of the
supply to drop below the level needed to power the display.
The switching transformer is mounted on the RF circuit
board, and is much, much smaller than the main power
transformer, which is usually fastened to the metal
chassis. The 22uF/16V capacitor used for C98 in early
BC300s was marginal, and was replaced with a 47uF/25V
capacitor in later units.

I replaced the 22 uF capacitor in the switching power
supply stage of a BC210XL which caused the same symptom.
Other capacitors in the switcher stage have failed. C114,
a 4.7 uF/35V tantalum capacitor failed in at least one
BC250, causing the display to blank.

>Thanks for the responce but, The BC9000 is not on Bill's list, I would
>appreciate if anyone knows how to do a mod to the 9000 for the
>discriminatory output!!

I published this in June 1996 Monitoring Times:

"Although it will void your warranty, it's easy to add a baseband audio output jack to connect the BC9000XLT to a CTCSS or DTMF reader, such as the CSI CD-1. You only need to drill a hole on the rear panel, mount a phono jack, and wire it to the appropriate point on the main printed circuit board (Figure 1).

Drill and deburr a 1/4" hole through the BC9000XLT rear panel, in the vicinity of the jack labeled DC13.8V. Mount an RCA-type phono jack (Radio Shack #274-346) through the hole and fasten with the supplied hardware. On the top of the main board, find the test point labeled TP3, located about 3 inches behind the AUX jack. You can choose to solder a wire to TP3 from either the top or bottom of the printed circuit board, but it's easier to solder it to the bottom because the bottom solder pad is larger.

Connect a wire from TP3 to the center pin of the newly added jack. It's a good idea to use very small diameter coaxial cable, e.g. RG174/U, but ordinary hookup wire will suffice. If you use hookup wire, connect another wire from the ground lug of the new jack to a ground pad on the printed circuit board, or place a solder lug under the nearest screw which holds the board to the chassis and solder the ground wire to the solder lug...." From: jtward11@aol.com
Message-ID: <19970223030900.WAA06488@ladder02.news.aol.com>
Source record: 206295

OK, lets make this clear for the guy.

The TrunkTracker will follow the talkgroups and subfleets used by a trunked system so that you can follow specific conversations and lock-out talkgroups and subfleets you don't want to listen to, such as the parks department, or sewer repair crews.

The 3000XLT will NOT follow talkgroups and subfleets. It will only scan the frequencies used by the trunk system making it very difficult to follow a conversation or even a particular department, for that matter. You will hear everything on the system, all randomly mixed together.

While the 3000XLT certainly offers some features the TrunkTracker does not, the biggest difference between the two is the military aircraft band from 220mHz to 400mHz. The 3000XLT has it, the TrunkTracker does not.

I am trying to find the freq's for the store "Incredible Universe". I know they are going out of biz, but have been assigned to them to help out w/ loss prevention in one department. Since my new duties are very boring, I thought it would be fun to listen in on what LP is doing in the rest of the store.

I have tried a www search and used Dejanews to check back usenet articals for info, but no luck so far.

Thought there was an online searchable database of freq's but haven't found it yet.

Any ideas would be appriciated, thanks in advance

How did you make the determination that the frequency usage
was illegal? Did you positively identify the call sign of
the party? Have you looked through all FCC records for the
license/call sign? It is VERY common for a license holder
to be licensed in the home company state but have the
transmitter listed in another. So if you heard the frequency
in New York, say, and searched all New York records for
the license and did not find it, that does not necessarily
mean they are unlicensed. The license may appear under, say
Arkansas with the transmitter listed as being in New York.
And if the license lists only portable units, then even
the transmitter location will be blank in the FCC data.

Granted, it is also common for agencies to allow a license
to lapse so that it will not appear in the FCC records,
but continue to use that frequency. This is one way some
agencies try to remain anonymous from the public. This is
also illegal, but so is listening to cellular/cordless
phone frequencies and we all know how much that stops
people. ;-)

RS is having a sale on the Pro 63, price is about US$125. At this price level, I'd be quite willing to look at a scanner. I am also considering the scanner as an early way to access ham frequencies before I get my license.

The models I see mentioned in this newsgroup seem to have much more frequency coverage than this model. Is there something significant missing from this scanner? Would the group subjectively consider this scanner at this price?

You can find scanners on sale via Damark...a 800 number
operator will get you theirs...

you will find they sell both desk and portable. and 800
at under 200...which is what you want...more sensitive
scanners.

but what area do you live in? large metro with plenty high
buildings or on a farm with plenty high hogs or do you live
in a suburb with plenty high ham sets.

How many frequencies in your hamlet or town or city which
you will want to listen to?

this will make a big impact upon what you will get for 200 big
ones.

so let us know and let's see what can be concocted from the
nucleus of the info you supply.

Not sure, but digging through the Revised Statues of Canada I had found, as claimed, that the government has declared radio frequencies to be public property. Thus, you should be able to listen away to your hear's desire like I do. For radio, as everyone in this newsgroup knows, is anything BUT private. Check with your local library for legal information. They're usually in those huge books in the reference section <g>

The draw back with the rs discone (and every other one I've seen) is 1 NO GAIN, 2 Really poor lowband performance unless that discone has an element cut for 6 meters? The upside is they are compact and have pretty clean patterns, as a matter of fact they make good satalite antennas.

No. The so-called radar guns actually use Doplar shift.
What happens is the "radar" sends a microwave signal out that is reflected
off the vehical and comes back at a differant frequency dependant on
the relative speed of vehical and speed gun. It the Doplar shift effect
that causes an ambulance siren to sound higher pitch when going towards
you and a lower pitch when moving away.

OH-NO now ya done gone and did it. Next thing now that the gov is gonna do will be to pass a law making it a crime to listen in on other folks conversations that you might accidently hear on the strreet corner. Ya shouldn't have posted that to give them the idea. ;-)

There will be no mods allowed to hearing aids to make them more sensative to distant conversations either. All big ear mics and shotgun mikes will be banned. It will be mandantory for all restraunt owners to provide a "cone of silence" fixture over each table and booth. All public phone booths shall have a 50 yard saftey zone around them to exclude the possiblity of an eavesdropper hearing the conversation taking place. All taxi cabs will have a sealed, souondproof passanger module so the driver can't overhear the conversation of the passengers. All other public transportation will provide cone of silence generators over all seats. Any person who can hear more than one conversation at a time will be banned from import into the country. The government will place specially trained dogs at all entrance points to the country to sniff out "specail ear agents" attempting to come into the country. All radio and tv will be banned with the exception of the official government channel to avoid someone overhearing something that they should not.

Fred

I may not always agree with what you say. But I will defend to the death your right to say it.

Exactly Darrell. According to Industry Canada, as long as the receiver is capable of receiving a broadcast, it is legal. Enivornment Canada's WX broadcasts are considered broadcasts, as our all amateur radio transmissions, marine wx info, and commercial radio and TV stations. These sections of the Criminal Code were passed, following the release of cellular phone conversations between the Premier of Quebec (M. Bourassa) and one of his aides. The House quickly passed the new sections. If my memory serves me correct it took about month from First Reading to Royal Assent. Guess MP's and Senator's came move fast, when one of their own is in trouble. Very similar to what is happening in the States.

Greg

Mark,
For under $200, your best best would be the Uniden BC220XLT
or the Radio Shack Pro-51(when on sale). The Pro-51 is made
by Uniden for Radio Shack and both radios are very similar.
The biggest difference would be that the BC220 uses a ni-cad
battery pack, while the Pro-51 uses 4 AA batteries. Also,
the BC220 has much louder and clearer audio than the 51.
You might also want to check out the SportCat 150. It is
a 100 channel version of the BC220 but does not have a
programmable search which hinders its usefulness in my
opinion. It is currenly selling for around $150 + shipping.
There is also the new RELM HS100 which is a 100 channel
version of their incredible HS200. I have had no experience
nor heard any feedback on this radio but if it is anything
like the HS200 it will be a great radio!
Good luck!

Hello Everyone,

I know this is a little bit off the subject ,but I need an answer to my question.
Does anyone here use Microsoft Internet Explorer to get to this Newsgroup? I am asking because I am looking into the Beta version of MS Internet Explorer 3.0 for Windows 3.1 & I don't want to lose this newsgroup if I decide to change browsers.
Thanks for your help.
Ryan

Ray,

One evening, while listening to a drive-thru waiting to place
my order, a friend of mine and I heard the clerks discussing
between themselves whether black or white women had better
breasts. You name it, you will hear it at the drive-thru.

Joe

3166. What's a Trunk Tracker??

Newsgroup: rec.radio.scanner
Date: 1997-02-24 00:00:00 UTC

Message-ID: <3311F2F0.7D99@bga.com>
Source record: 206025

Hello all,

The subject says it all: what's a trunk tracker? Is it a system allowing the listener to move from one specific frequency to another so he/she can follow a conversation? Or is it a way to locate lost luggage? Thanks for the reply...

Chris

> The AOR 2500 is wide open in coverage. Will they be required to disable the
> 800 Mhz area?

Da> Damn good question! If you find out please let me know!
Da> I have a 2500 that I need to send in to get realigned...I'm afraid
Da> that they will block the 800mhz section in it.

Ahhh, but the FCC now says a scanner can't be modified, which
is what the factory would be doing if they blocked anything.
The rules have to apply equally, both ways.

Message-ID: <3311574D.73A3@ptialaska.net>
Source record: 206035

Simply making the element 5/8 wave in length would change the impedance from the design 50 or 52 ohms for a 1/4 wave to something far enough off that commercial VHF 5/8 wave antennas include a matching transformer in them to match the transmitter. You'd probably lose at least as much due to VSWR mismatch as you might otherwise gain by lengthening the element. The radial length shouldn't actually matter, as long as they are long enough for the lowest frequency being used. Hope this helps.

DITTO!

They already have their $$$ from the advertisers. Guess they don't care if anyone actually READS the rag. There are lots of other magazines out there that operate in the same fashion, but at least they PRETEND to need the subscribers.

Another 90s thing I guess...The $$$ rules...Do whatever you can actually, physically "get away with"...nothing more, nothing less!

Ah yes, I remember when... :-)

Cross-posted to: rec.radio.scanner,alt.radio.scanner

On most scanners I have seen the lower 800MHz section is blocked out.
What is in this section? I know that cellular is in the upper section,
but I have never heard of what is in the lower.
Just curious.

Hey, Don't knock it until you try it!!!

The employess often like to gossip about other employees
and will also make rude remarks about the customers!

It gets very interesting during the summer months when
school lets out the teens get jobs at the Fast Food joints.

Actually, if a person is so stupid as to call a psychic in the first place, they are probably too stupid to notice the fine print, and will call up and get suckered in anyway. They just tell you totally generic stuff that applies to everyone, and you think they have psychic abilities. I think it was well done when this one guy (goes by a name I can't remember, "something the great") who goes around and exposes such fraud (as an ex-defrauder himself) took a picture of the pleasant looking, and for the picture, smiling Jeffrey Dahmer (serial killer and cannabal from Milwaukee) to some psychics and asked if they could tell him about this man. They said things like he was a good christian, a military man, well loved by the community, and very nice. You know, generic good stuff. :) Boy did THEY get it wrong.....sq

(people who call psychics don't realize they are getting pumped for info while they are talking. Probably the conversation goes like this, the psychic says "you are having trouble at work" [and who isn't?] and they say "why yes I am, how did you know?" :) Good "psychic statements" can be 1. trouble at work, 2. trouble with wife, 3. not enough money, 4. need a vacation, and etc. I think you see my point.....)

I am very curious as to just how much money is lost due to theft
of this nature each year. The people who do it claim they are
millionaires, but I have no way of knowing for sure. I mean, you can
rent a mansion to film your scam-fomercial in. It saddens me to think
that there are enough stupid people in the world to encourage others to
continue scamming like this. If they aren't making money, they couldn't
continue the expensive (half hour or more) long commercials! Someone
simply MUST be buying into their scams. What ever happened to the good
old days when people only stopped you and asked you if you wanted to
buy swamp land in Florida, or perhaps purchase the Brooklyn bridge? :)
Scams from the past seem campy, but people "made money" doing that at one
time in America's past, believe it or not. Things haven't changed....sq

(perhaps the goverment should air infomercials WARNING people about these
scams, saying that money without work is impossible, and etc.....)

3188. Winradio, What's it like?

Newsgroup: rec.radio.scanner

Can anyone tell me what the Winradio is like?

What's it below 30MHz performance like compared to it's above 30MHz performance?

What's the software like?

Are you stuck with the software that came with it and what's the original software like (any bugs)?

It's kind of marketed as a serveillance receiver or a less expensive ICOM R9000 or R8500 receiver with coverage up to 1300MHz instead of 2000MHz. How does this radio compare to the two ICOMs and the AOR AR5000?

I would like any owners of the Winradio to email me dirrectly.

I have a purely software based (w/ soundcard) speech inverter I'll
give away to anyone willing to test it. Reflection point is
variable (slider control). Windows 95 based (32 bit). Processing
requirements are fairly high. Never tested it on anything less
than a Pentium 133. Also requires a full duplex driver for the
sound card (Sound Blaster 16s, 32s, and AWE 32 have these available).
Send Email if interested.

But what about those spammers who are submitting their spams
from an anonymous access Usenet posting service (zippo.com, dejanews.com,
and maybe half a dozen others)? What about spammers who submit using
bogus headers, and get some innocent persons account killed?

As it stands, anyone can submit a spam under any header, and if
that header contains a valid Email address, the person who they chose to
use will undoubtedly get the blame. The only way to prove your innocent
from such an attack is to examine the bangpath (Path: site!previous!host)
at the top of the spam. That will show the site of origination, and if
it doesn't match the Email, you know it's a bogus. I never forward the
bogus back to the postmaster@hostsite or root@hostsite.....sq

(always verify the poster to the bangpath and nntp posting host! Never
become part of the problem by forwarding spams to sysadmins of
innocents!)

And then you attached a copy of trunker.zip.

This is version I compiled, from my FTP directory, of the code posted by arron5. Same file, same timestamp, same name (that I invented because arron5 didn't mention his original filename.) I posted it there for the convenience of people who were complaining that they couldn't try out the posted code because they had no compiler. I was trying to reduce clutter in the newsgroups.

So: GO TO HELL, ASSHOLE!

When you post binary files to non-binary discussion groups, you make it harder for some people to get those groups. Sysadmins with limited disk space will drop groups if they become "hidden binaries" groups. Or, they will make expire times shorter. They are forced to, by lack of space.

That's why there is a rule against it, and that's why I specifically said DON'T POST binary files to discussion newsgroups IN the post where I announced the availability of that compiled executable. CAN'T YOU READ? CAN'T YOU FOLLOW INSTRUCTIONS? Obviously not.

OK, you want it, you got it. Those files are now removed from my FTP directory. I will post something similar again WHEN HELL FREEZES OVER.

I hope Depew bincancel's your post ASAP, you moron. Posted and emailed.

3197. HELP! I Have More Questions!

I have some more questions maybe one of the more experienced users here could help me with. I just bought a RS PRO-70 to start. My questions are with frequencies and here they are: What is TRUNKED POLICE FREQ'S? What is a REPEATER? and what is a INSTANT? also, how many digits do you have to enter? On one of the freq's pages there was a message that said you can listen to your local radio stations with your scanner, why someone would I don't know, but how do you enter them? I was trying to get the station I listen to most (102.9) and it came back as an error, I entered 102.9000 and nothing. Am I doing something wrong? also on the back of my scanner (PRO-70) it says "FREQ. RANGE 29-54, 137-174, 380-512 MHz" I've tried entering a 8xx.xxxx freq. and it came back as an error, can I use those?

Any help would be truly appreciated.

Many state police agencies (Including Wisconsin) now use computers to calculate the average speed of a vehicle over a certain distance. So, while a radar detector may help you in certain instances, it won't help you in all instances. These computers measure a certain distance to be determined by the operator. The minimum is about a quarter mile, and can be switched very easily. The officer times you while he is driving...either behind you or in front of you...and comes up with an average speed. The excuse of "just topping a hill" or the like is now shot out the window. Bottom line...get your check book out!

Ah! Timely question!
The flap over a certain politician's conversation being overheard and recorded from a scanner has changed things. While it used to be that Customs didn't care about individuals importing unblocked scanners, that may well have changed. And, personally, I'd hate to be the object lesson to the nation by having my $2000 radio confiscated as an illegal import.
Also, are you sure that ICOM even has an unblocked version available?

There is only a prohibition on importation or manufacturing of scanners
capable of tuning to, or being easily modified to tune to, the cellular
bands.
There is nothing in the laws or rule about scanners that are already
capable of being tuned to the cell bands.
So, there's no reason for any repair shop to do anything about your
full coverage scanner.

Absolutely right.
As for "why now", it's the fact that one of theirs got caught doing
something
very illegal. it should be noted (and noted very well) that the thrust
of
all the energy being expended is *not* being directed at the ones who
were
cought, but rather at the fact that they were caught.
Why? Because each and every one of those congresscrittere knows that
this
goes on all the time, and they simply don't want to get caught at it. Of
course, it won't be put that way; instead, this is for *our* good, as
all these
new rules and laws and interpretations of old laws will ensure our

"privacy",
but the real reason remains protection of the lawmakers.
Remember, none of this made any impression until Newt got caught, and at that point, the machine went into high gear. Nothing makes a congress-critter move faster than when *he* steps in the cowpie. The result is becoming more and more predictable: make cowpies illegal.

This sort of paranoia seems to accompany all new inventions.
Do you ride a bicycle to work instead of a car because you're worried
about an engine failure?

How often does your computer go boink? If it does, you'd probably
have it fixed pronto NOT because of radio but because you'd be cut
off from the Net!!!

I have been using AOR products before, then switched to Winradio
for all my VHF/UHF listening. I never looked back - I love
the comfort, more space on my desk and no messy cables either!

Cheers,
Peter

After firing up my scanner and linear amplifier, I overheard a call the other day, it went like this:

"Al, we've got to find a way to get taxes from the Net..."

"Yeah, I know Mr. President, they are trying to cut us out of all the dough, I wonder if we can get the DNC boys involved, they know a few shortcuts..."

"No Al!, It wouldn't be prudent, besides we got to set you up for 2000 and get me a house and a gig for my retirement, Hillary is going to set up a new law firm and doesn't want me in on it, maybe Billy Gates can write us an intercept program for all electronic fund transfers to get us some dough.."

At this point a lamp is heard crashing against the wall and the conversion ends.

>would be appreciated! please send mail to the address below!

Federal frequencies tend to have very low usage, so unless you have
plenty of channels available and monitor on a regular basis, you'll
find persuing them to be rather boring compared to the other stuff.
Every jurisdiction has their own version of the ten-codes, and maybe
someone in your area will provide yours. In the meantime, some of the
more common in Wisconsin are:
4 OK/Acknowledge 21 call by phone
33 emergency 43 information
46 disabled vehicle 50 vehicle accident
51 ambulance 52 tow truck
55 DWI 56 intoxicated
95 arrest warrant 96 prisoner

2 (I'm) OK 20 location
1 signal bad 27 driving record
28 registration data 41 beginning shift
42 ending shift (or DOA/fatality)

Hope my feeble memory has kept those straight.

Mark

The truth as I perceive it to be.

There are converters (if you can find them; they are now illegal to
import or manufacture in the US) that can move the 800 - 900 MHz band
down to a position your scanner will tune them. Up to 1300 MHz? Not that
I know of.

Young college student stopped by police officer at about 11pm on a major street. Gets out of car, throws radar detector on the ground and begins stomping on it. Cusses at inventor of radar detector and the money he spent on it.....So I gave him a warning for driving without his headlights on (the reason for the stop in the first place) and he is on his way.

Message-ID: <856826993.19818@dejanews.com>
Source record: 206117

If anyone can help me with the issues below, I would be most greatful:

Can anyone recommend a reputable vendor in Canada that carries the BC3000-XLT with cellular coverage?

Are the warranties supplied by importers honored in the USA as if they were purchased in the USA?

How is the performance of the BC9000-XLT compared to the BC3000-XLT? I was reading in this month's Monitoring times that the adjacent channel rejection ability for the 9000 was greater than the 3000 (I believe the ratio was 59 to 48)? I thought the both units were similar with the exception that one was a handheld model and the other a desktop unit.

Thanks in Advance, Gus

Yes there is... 800Mhz coverage. If you live in a town of almost any size,
then the police, fire, medical, rescue, etc. have moved to 852-868 Mhz.
However, there is still alot of neat stuff to listen to in the 400-512Mhz
band, such as morning traffic reports, businesses, etc. All depends on what
you want to listen to. By the way, I got the PRO-51 on sale at RS for $200,
if you can find it for this, it is well worth it!

Hi,

I am trying to determine the type of trunking radio system the Suffolk County Police Department is using. Is it any of the following Motorola type one, two, two i, or hbrid system? If none of these what is it? I'm just curious if the new Bearcat 235XLT-A Trunk Tracker scanner will be useable for scanning SCPD.

Thanks in advance!
Bill (wpo@ix.netcom.com)

With good reaction time and GOOD brakes (911 Turbo), by paying attention
you can foil 'em every time. Wish I had a nickel for everytime the Cop's
radar took too long to lock in!!!
Of course everything under the seat flys forward and passengers don't
particularly like the G forces associated with "slowing down" for instant
on radar!!!

Happy speeding.....

Boy, I don't know for certain, but I would guess it won't be a problem for the TrunkTracker. After all, it is monitoring and responding to the same data on the control channel that the "real" radios on the system are reacting to, so it should respond in the same way.

Are you certain you city is using a Motorola system?

> > for us to be able to conduct such business on a personal level.

Well how do you explain the fact that you CAN gain from selling your
gear as long as you don't make a habit out of it? If I can't order a
pizza as you claim, how can I even think about selling a rig where I DO
gain from it? If that isn't a personal pecuniary interest, what is?
Remember, that is specifically allowed per Part 97. Also, as I recall,
the pizza example was given by the FCC. IF you want to be more strict on

the rules yourself, fine. BUT, don't think that just because you interpret the rules a certain way that everyone else has to follow you. ID every 5 minutes if you want rather than 10. Make sure you operate over 10Kc away from the band edge rather than 3 or 5Kc. You can go 49 MPH in a 55MPH zone, too.

Besides, I just love ordering a pizza via autopatch and then let them follow me around trying to deliver it until it's free. (See, no monetary interest!) ;->

By the way, everything after the FCC clarification line is NOT intended to be taken seriously. :)

Oh, about the second thread about getting the control op in trouble - I'm the primary control op and trustee. It's my call so it's my call. And about the clarification involving public service - I don't remember that in the pizza example.

I just built the Ramsey kit for a friend, and it works fine for
descrambling speech inversion on all the signals we tried it on.

I compared it to my AOR-8000 with it's internal DS-8000 descrambler,
with very satisfactory results on both units.

There must be some other reason your associates were unsuccesful.

Simple: The Cellular industry was loosing sales (MONEY!) by the fact that these 'radios' use the public airwaves. Rather than spend money incorporating digital technology, they found it was cheaper to 'buy' an FCC rule. Now they can tell their potential customers that 'It is impossible for someone to listen to you. See, it says so here in this rule.'

> If we unblocked these frequencies wouldn't it make it harder for drug
> dealers, criminals and the like to carry on their business?

Yea, right. We are talking about the government here. Since when did they do the right thing when there is money to be made and pocket to be lined? You can't really blame them completely - they are under a LOT of pressure to balance the budget. So, rather than give up the money they stand to gain, they try to suck more out of the public. They have sorta the same mentality as the company who sends you a bill for that last 15 cents you owe them - using a 32 cent stamp to get it to you! Am I the only one who sees the failure of logic here?

Also remember that the drug 'industry' is one of the biggest sources of revenue for the cellular and paging companies. Now they wouldn't want to risk losing their larger customers, would they? Remember, paging frequencies were also 'banned.' The only difference is that those frequencies are a lot harder to block out of a scanner. You have some on 'low band,' some on 152 MHz, 157 MHz, 158 MHz, 163 MHz, 454 MHz, 800, 900, Etc. If you would try to block those out as well, your bandplan would look like swiss cheese! Then just TRY to do a search from 151 to 153 MHz.

The following seems to work for finding the answer to ANY question like the above: 'FOLLOW THE MONEY to answer the question why'

>Just a thought.

And what a fine thought it is, but unfortunately, the CTIA would rather you not be able to listen than worry about criminals using their phones. This has been brought up time and again in arguments against the ECPA and subsequent addendums.

Their position above all others is that ALL phone conversations are private, regardless of their origin or mode. Note that wireline phone companies can be held liable for criminal activity promulgated with phone company equipment, but Cellular providers are held harmless from the same. Guess whose hands are deepest into Congress' pockets?

(Snip)

I know a guy who was openly worried about his home refinishing
business. He was constantly losing bids to one specific company. He
used his truck for most of his work and had a cellular phone which he
also used for fax and computer modem use. I told him that it was
possible that someone was listning in on him and scoffed at me
(primarily because I'm a chef in an Italian restaurant and shouldn't
know anything about cellular phones.). He said it was impossible,
because of the law. I eventually gave up on him.

I just thought of something.In Akron, I can pick up a block of
cellular phones in the 1400 Mhz band. They are all very clear and
appear to be all Cellular one (or whatever they call themselves now)
No GTE Mobilenet. They don't have the same sound as an echo od ghost.
I wonder, could there be relays there? And if so, then people are
REALLY deluding themselves if they think they can't be heard.

3252. What's an FBOM?

Are you reading this? Great! That means it wasn't written it for nothing. Not to worry, you won't be wasting your time.

Amateur Radio is a hobby and like all hobbies, it needs to be fun and rewarding. We at FBOM Magazine may not be able to straighten out your 40
meter beam after a hurricane or stop commercial satellites from squatting
on your VHF repeater input, but what we can do is present a lighter side
to all the QRM.

FBOM Magazine is the new generation of radio hobby publications, focusing
mostly on amateur radio operators (Hams). FBOM Magazine is for everyone,
from the guilt-ridden Extra class ham to a Technician or CBer that's tired
of being blamed for the erosion of family values in America. FBOM Magazine, the official publication of the Bad Signal Club--A free-thinking
state of mind where you are certified to transmit scratchy signals, crack a
joke without saying "hihi," tune up on some Little LEOS and have a good
time laughing at others as well as yourself.

As if that wasn't enough, FBOM also pokes it's nose into the world of the
scanner junkie and the strongest competition to wireless communications,
the Internet.

*
* GET YOUR FREE SAMPLE ISSUE!!!
*
* Email N9VJG@aol.com now for your free sample of the latest issue!
*
* Visit our Web Site which is still under construction and
* in bad need of updating. Just nudge your favorite browser to:
* http://www.interaccess.com/uncle-del/FBOM/.
* If you have America Online, visit the FBOM Magazine folder
* in the Ham Radio Forum message boards, under "Manufacturers,
* Dealers & Vendors."
*

Why YOU should subscribe to FBOM Magazine:

1. You will earn your official Bad Signal Club membership and will be
able to operate any bands with a scratchy signal and tell the
complainers
to stick it where the sun doesn't shine.
2. Blatantly hilarious and unusual commentaries on life as a radio
hobbyist.
3. No boring propagation charts. We replaced those with "Radio
Horoscopes".
4. No articles for home-brewing outrageous tri-banders and RF amps.
Just
step-by-step guides on how to build contraptions like a
"rubber-duckie
plane" for your HT and how to clean nasty things out of your
microphone.
5. Wacky contests where you can win antennas, free chunks of used
RG-58
and other prizes.
6. Free classifieds for paid subscribers.
7. We don't make you feel inferior if you work channel 19.
8. Hey.. we're writing it, so why aren't you reading it?
9. FBOM is 100% biodegradable and fat-free!
10. No test is required for this upgrade.

Why YOU should subscribe to FBOM Magazine NOW:

Rates are CHEAP! 2-year (4 issues) subscription rate of $9. 1-year
subscription rate (2 issues) for $5.

For only $9 you can have 4 issues of FBOM Magazine delivered to you.
Hey
that's a pretty good deal--especially for a publisher that is terribly
desperate to gain more subscribers!

How you can give us your hard-earned money:

*
* Mail a check or money order for a 1 or 2 year subscription to
* "Eric Bond" (That's me, the publisher and janitor) and send it
* to FBOM Magazine, P.O. Box 7711, Westchester, IL 60154-7711.
*

(FBOM Magazine c1997)

Ok, I'm very new to the scanning scene (just bought a small PRO-70 to start) and I'm looking for some good freq.'s, I have the districts, sheriff, etc. but I heard there are some FBI, DEA, etc. freq.'s out there, I just can't find them? also looking for the codes the MPD use, I have no idea what their saying! Also, can this model be upgraded (modded?) and help would be appreciated! please send mail to the address below!

I have a 10 meter Radio Shack mobile radio for sale. It's made by Uniden and has 25 watt output. You can also go to low power (5watts). Store freqs., scan, VFO, and other features. I want to sell it for $175 or will trade for a hand held scanner or even a mobile scanner.

The problem with the Ramsey kit is the use of the PAL color burst crystal. It yields an inversion carrier of 3.3 KHz, while most departments implementing fixed frequency speech inversion use carriers closer to 3.4 or 3.5 KHz. The resultant, 'descrambled' audio is then several 100 Hz too low. I've built my own versions of the MXCOM MX-118 based scrambler (full duplex for communications work, and half-duplex for... well... just listening work), all surface mount, on a 1" x 1" single-sided PC board that will sticky tape to the inside of just about any radio.

Finding a supply for crystals for my version is another trick. If someone can point me to a cheap source of 4.65 MHz +/- 0.5 MHz crystals or even ceramic resonators with 0.3" pins (or SMD even better!), I'll gladly make a Postscript copy of my PC board available on my web page.

Posts are read, but my ISP's server is a little deaf, so e-mail for reliable communications.

I have one of those Grove No-Tenna's, and one of those little splicers that use your AM/FM antenna for your scanner. While I have had limited success, they don't work nearly as well as Radio Shack mag-mount scanner antenna, or perhaps a dual-band ham radio antenna.

Ryan,
The USENT newsgroups available to you are a function of the news
server you use and NOT the browser. If you get a new browser but
"connect" to the same news server, you will have access to everything
you did before. You will loose your "spot"(what you have and have
not read) but everything else should be just fine!

>> references for Atlantic Ham Radio in Ontario.

An honest and competent ICOM dealer in Ottawa with a lot of receiver
experience is our sales rep up there:

Signal Technology Associates
Steve Clark
1427 Ogilvie Road, Suite 104
Gloucester (Ottawa) Ontario K1J 8M7
613-742-1580
613-742-1561 fax

They primarily are government suppliers, not ham dealers and generally
do not deal with the public. Mention me and Steve Clark probably would
help.

BTW, blocked R8500's CANNOT be restored due to design. Only ICOM
receiver so far that cannot be restored fairly easily. R9000 was never
made in a blocked version, and all R7000's remaining in inventory are
unblocked.

Steve

Jeff,
I personally would not recommend Metrosoft. They screwed with me once
and will not get my business again. I would recommend Communications
Electronics of Ann Arbor Michigan. Have good prices but higher shipping
costs. They've done good by my for my Uniden needs.
Last I knew they were offering something like $20 off the tone
board...see their ad in Monitoring Times for "coupon".
Tone board is an easy plug-in. Good luck!

THAT WOULD BE VERY INTERESTING. How do you fit a speech inversion chip on a 1X1 pc board with the associated components? By ceramic resonators, are you talking about the small orange plastic things inside of just about every TV remote control or is that actually a crystal?

Every so often I see someone damning this or that politician for real or imagined slights to our hobby.

Willie and the NewtMeister are the two favorites, of course.

I always think of that net.signature that says "Never ascribe to malice that which can be explained by stupidity".

That covers most of it.

Of course, I am a little puzzled by the present government's (not administration - I mean *all* of 'em) persistent attempts to enable the forces of Law and Order to be able to monitor absolutely all electronic means of communications (Clipper attempts 1, 2 &3, the forcing of the cellular carriers to provide easy access points for the forces of Law and Order, the attempts to keep strong encryption out of the hands of the public at large.....)

It's not that they've tried this, it's that they're trying, over and over again, to get this stuff into law (where they haven't already succeeded) - that's puzzling - ordinarily our duly elected representatives have the persistence and attention span of your typical village idiot (with apologies to the village idiots of this world).

Wonder who's prodding them along?

As I said, normally I ascribe most of the government's unfortunate actions to stupidity, it's just that when your favorite idiot suddenly starts showing long term purpose and persistence.....

Thank you Brian. However I'm afraid no matter _what_ I say, the scammers are going to continue on the Usenet. In fact, I'm starting to see the MAKE.M0NEY.N0W posts, with continually varying texts (to avoid my killfile) in ever increasing numbers. This turkey just found another way to scam, and I'm afraid tho he is an early "sell simple info" guys, they will increase in numbers, as they are already about 50% of the classified advertisements seen in most magazines (the other half is for 1-900-sex-talk ads). :-/ Some guy on late night infomercials is selling a how-to package to "sell simple information in classifieds, and become a millionaire" scam. People don't realize that HE is a millionaire by scamming would-be scammers! :-/ Now he has sent forth all of his customers (whom he's scammed) with ideas how to scam others, and the domino effect begins. It will probably get much worse.....sq

Knowing that many of you have an interest in Fire and Disasters....

Anatomy of a Disaster / Earth's Fury

The Learning Channel
Monday February 24
will show -twice- (evening and night - times vary by zone)

I have only seen (very) rough cuts of this episode in a series which will highlight major Fire Disasters. TLC staff usually do a remarkable job, and from what I saw, it looks like it -should- be worth taping.

FYI: Due to a late programming decision by our friends at TLC, the program carries different titles in domestic and foreign release. Look for either "Anatomy of a Disaster" or "Earth's Fury" in your local television guidebook.

NOTE: Questions or comments regarding this broadcast (or requests for tapes) should be directed to The Learning Channel. If it is a decent program and you would like to see more: SOUND OFF! You can reach their website at:

http://www.discovery.com

Stay Safe!

>about divulging what you heard, as well as using what your heard for
>personal gain.

The law apparently considers all land mobile radio users as "private"
communications - that would include trains, tow trucks, or pit crew
comms at auto races, as well as police.

I've seen plenty of Radio Shack ads - in major Canadian newspapers,
as well as their own flyers - which described scanners as a way of
listening to things that the law apparently considers "private". They
often use a slogan like "Find out what's happening in your
neighbourhood" in their ads.

It would be interesting for the government to have to explain
why there hasn't been a crackdown on RS's advertising!

Regards
Paul

>
>Personally I use a radar detector to keep me honest. I find that I
>speed less when I am using mine because I check my speed more often
>than without one.

I bought one of the "Zapper" gadgets that activate radar detectors. It turns on the x-band side of the detectors. What a hoot. It also keeps me from speeding (though I've never had a problem with anyway.) I find that I stay right at the limit so more of the knuckleheads that speed can pass me, and when I see a detector..."Zap!" and the brake lights come on.

Five points for an obvious slow down.
Ten for brake lights.
Fifteen for a real "dip of the front end."
Twenty for skid marks.
Twenty five if the car leaves the road.
Fifty if it causes an accident.
One hundred if it involves personal injury.

(Just kidding about the point system after 15 points. Don't want anyone to get hurt.)

One officer where I used to work would stand outside his police car, radar gun in hand, and aim it down the roadway...but it would be off. He got a charge out of seeing the folks with radar detectors who obviously thought their expensive gadget quit working.

Well, here is the deal:

The trunk tracker, tracks MOTOROLA systems. The system you are hearing is an Ericsson.

Eventually Undien will make a trunk tracker that can track Ericsson, or EDACS systems, and it will cut out the beeps and the buzzsaw.

You can buy a chip called a G-Wiz board. It can be installed in your scanner and it will cut out the buzzsaw and beeps right now. It costs about 90 bucks though.

Due to its design the Ramsey kit apparently will not work with general
speech inversion. Apparently it only reconstructs signals from another
Ramsey. I haven't tried it, but several associates were not able to
use the Ramsey piece on ordinary speech inversion received over the
air.

You want something with a variable injection frequency. The old Capri
kits worked very well for this if he will still sell them.

3293. LMR - ICOM LMR prices going up March 1st

Newsgroup: rec.radio.scanner
Date: 1997-02-24 00:00:00 UTC
From: Steve@swssec.com
Message-ID: <33110086.53134225@news2.ibm.net>
Source record: 206217

FYI, ICOM's land mobile prices for mainframes are going up on March 1st. Average increase on current models is 12%.

This is ICOM's increase, not ours.

Prices have decreased on discontinued models still in stock, like U18 and U8.

Anyone thinking of picking up ICOM commercial might want to do so in the next few weeks.

We are ICOM land mobile dealers and would be glad to help with sales or service of two way, receivers or accessories. Also warranty service or programming assistance for anything ICOM.

R10 and R8500 receivers in stock, unblocked OK to legitimate two way firms.

This is the second in the line, the first being the BearTracker (self explanatory). In 98Q1, Uniden expects to have an AssTracker, apparently bowing to political pressure from the Lippo Group.

Hello all,

I recently began listening to the 800Mhz Massachusetts State Police
freqs again. Last time I tried they were not too active, now they are
buzzing.

It appears that rather than listen to all 20, that they seem to be broken
up into groups. Has anyone done any homework to figure out what
set of frequencies may be linked to form a channel? It appears that
one set of 5 frequencies (or so) are always following the same conversations.
I'd like to be able to break them up if possible.

Thanks,

Steve

You could buy an adapter from your local electronics store which
changes the output from mono to stereo.

The adapter you are looking for is a 3.5mm Mono plug to a 3.5mm Stereo
Socket, I have one so I can plug my scanner into my stereo, and have
both speakers working instead of one.

Thanks Mark

ooooh. and i have been at a lot of news situatons where
great thinking radio news gatherers bust through the
line which the cops allow me to get video from and then
go into the scene uninvited to get a "interview" with the
IC. Only thing is is that there are chemicals being put
out and here are these "idiots" with mic's in hand attached
to their recorders putting mic's up the noses of the people
who were there to get the situation contained.

at that point, the cops just said: "all right, everyone out
of the area. Go back to that spot where the black and white
is....which of course was positioned behind a fire truck.

too many stories like this where "radio reporters" think they
deserve special treatment and in the process screw access given
because the police wanted to allow access at a safe distance.

bill conduit
etc.

Oh gee, well I happen to like listening to the railroads and find it very interesting. I agree cellular is such a bore, I don't even listen to it at all. But, at times even listening to the police, the fire department, and the ambulances gets very borring. Oh, I also left out fast food restaurants. I personally like to find new frequencies and also frequencies for those businesses that act like their frequency is TOP SECRET and confidential information. I love to locate their frequency and then let them hear their talk coming from a scanner. I guess that listening to a scanner can be boring for different persons for different reasons. But, maybe that is why we are individuals and not everyone exactly alike. And by the way I have been listening to scanners for over 23 yrs. Good scanning!

The FCC says "4. Scanning receivers, or "scanners," are radio receivers that can automatically
switch among four or more frequencies anywhere within the 30-960 MHz band."

Does that mean a receiver is not a "scanner" unless it covers all those frequencies, or does
it only need to cover some to qualify?

Also, wouldn't that mean that a cellphone qualifies as a scanner, since it can automatically
switch among four or more frequencies within the 30-960 MHz band? If that is the case then cellphones must have the cellphone frequencies cut out as well or they are illegal. What a concept!

Hi Peter,

How does the performance of WinRadio compare with a non-computer desktop unit?

I know that my BC9000 starts to sing when the computer is on. I just wonder if the interference generated by the computer upsets the Winradio card at all?

Cheers!

Well, then.....how about doing away with the whole "licensing structure"
and fire that part of the FCC staff, and use the money to hire more Feds
to bust the druggies. Who cares what part of the spectrum anyone uses,
just as long as it serves their purpose...RIGHT????

There are other excellent means of direction finding that are real'
cheap!

My friend and I did a lot of ham fox-hunts a couple of years ago. We
found the
"fox" every time. About half the time we found the fox before the
doppler guys
too.

Two people and two handies work like a champ.

All you need is a radio with an Smeter and two antennas.
Hold the handie flat up to your chest vertically and do a couple of
rotations.
You'll see the signal peak and null. The null means that the signal is
eminating
from behind you. I'm not sure, but I think the spine acts as a
"reflector"!

As you get closer to the source, use a rubber duckie for the wrong
band. ie: if
you are chasing 146MHz use the correct duckie until the Smeter shows no
null then
plug in a UHF stubby. Repeat the process untill you are using NO
antenna. Once you
get FSD (full scale deflection) with no antenna you should be within
visual distance.

Start beetin' the bushes!

The key is that you need two people to make this work. Reflections play
hell on VHF and
UHF signals. So you and your friend should hop out of the car and stand
20 or 30 ft apart.
When you both get readings that agree - you've got a good direction (90%
of the time anyway!).

Good luck - it's a riot!

Cheers!

SD>Hello all,

SD>I recently began listening to the 800Mhz Massachusetts State Police
SD>freqs again. Last time I tried they were not too active, now they are
SD>buzzing.

SD>It appears that rather than listen to all 20, that they seem to be
SD>broken up into groups. Has anyone done any homework to figure out
SD>what set of frequencies may be linked to form a channel? It appears
SD>that one set of 5 frequencies (or so) are always following the same
SD>conversations. I'd like to be able to break them up if possible.

Steve, I have been monitoring the following channels in the Boston area, with pretty good success. This is the trunk primarily for Troops A and H, although you will hear some Troop D traffic as well. As follows:

860.9857 860.9625 860.7375 859.7125 858.9875 857.9875 857.7125 856.9625 856.7125

You will mostly get the SP, although from time to time you will get other agencies that use the trunked system.

Phone patch is 859.7375. This is sometimes interesting, as the people who use it, because they have been told that no one else in the system can hear the calls, think that no one can hear the calls. As a result, they will sometimes talk about some pretty sensitive stuff, under the impression that it is secure.

Barnstable, which is in Troop D, uses 856.2625 856.2125 855.7375 854.2125 and 852.3625

I have been told, and it seems to be true, that programming the frequencies in descending order works better .

Gary

Unfortunately, I must agree with this gentleman.
I am (or used to be) a avid reader of N/V, but I can't understand why
even though I paid for a 2 year subscription I recieve the majority of
my issues around the 25th of the month. i was very surprised when I went
to HSC & found them with piles of NV for FREE at the first of the month.
I feel my subscription money was wasted, I could go get it for free &

most importantly - ON TIME!
I hope someone from NV sees this as you can gurantee I will NOT be
renewing my subsription. I will just get it for free from the surplus
place. I'm not saying it's a bad mag, just that the subscribing benefits
are not there, making it pointless.

Hello all,

I've yet another question: how 'sensitive' is 5uV? I have a PRO 26 on the road to me, and the online specs from Javiation read 5uV for some bands. I own an old BC210xw; will the PRO 26 pull in signals as well as this? I guess handhelds, due to their smaller antenna, recieve less than their base counter parts.
Thanks for the replies...

3342. ar1500 programming, help needed (long)

Newsgroup: rec.radio.scanner
Date: 1997-02-25 00:00:00 UTC
From: thorsen@club-internet.fr
Message-ID: <3312dc74.6285240@news.club-internet.fr>
Source record: 205967

Hello all !
I've a problem with my ar1500: i've messed up the programmation. just close to the speaker behind the battery pack, inside the scanner, there is a little switch without notification, it's just solded to 2 wires. Naturally, i've touched it to see what happend, and found myself with a dead scanner. With a little search i've found an article by Lionel Ancelet on the net about ar1000 programming, and I saw it was just the same; this damned little switch is used to reprogramm the unit.

Here is the sequence for the ar1000 i've used :
BANK
1 PROG 0.5 LIMIT 29.995 SEARCH 561.225 ENTER
2 PROG 30 LIMIT 219.995 SEARCH 561.225 ENTER
3 PROG 220 LIMIT 409.995 SEARCH 561.225 ENTER
4 PROG 410 LIMIT 599.995 SEARCH 561.225 ENTER
5 PROG 600 LIMIT 904.995 SEARCH 251.575 ENTER
6 PROG 905 LIMIT 1209995 [down arrow] 251.575 ENTER
7 PROG 1210 LIMIT 1300 [down arrow] 561.225 ENTER
I've checked with another receiver tuned on a local radio (101.9MHz), and there was a shift of 4.9 MHz on the ar1500. I've modified the third parametter (561.225) on the 4th bank to 556.325 and it seems to be right tuned for this range of frequency but I'm stuck with the others bands.
Has anybody ever tried to do it ? Or know wath is the 3rd parametter ?
You can answer here or e-mail me at thorsen@club-internet.fr
Thank you !

The manual is still available through Radio Shack/Unlimited at a cost
of $6.13 plus $1.00 Shipping and State and Local Tax where applicable.
They will mail it to your house and delivery usually takes 5-10
business days.

The Pro-51 is a great scanner and $145 sounds pretty reasonable. I'd
buy it myself but I already have one!

>Internet, police said.
>
Hmmmmm.

Date rape due to the Internet.

How many women have met men via the Newspaper LOVE FOR NEED
columns all over the USA and met up with a MID-NIGHT CHANGER.

question mark.

Did they outlaw these newspapers or curtail the volumes of ads
appearing over and over throughout the years since this first
began back in the 60's with papers such as the Berkeley BARB
and SF Bay Guardian and New York Village Voice and more.

question mark.

for some reason these ads just increase and women continue to
advertise for a LOVE MATCH and no one is trying to put the
newspapers out of business with LOVE COLUMNS as an obscenity
to be kept from the viewers because of a possibility that a
woman OR MAN may be "date raped".

Why? It's big business. MONEY. Look at the volumes of 900
numbers to call to get your ideal date's attention. Look at
all those boxes you pay for to get your "private mail" which
is forwarded to you.

These ads make a lot of publishers rich. How many lawmakers
and judges and cops and district attorneys and the whole system
of "money" have interests in these behemoths of "LOVE FOR SALE"

question mark.

They have a financial stake in keeping these columns alive. The amount of money involved is staggering when you think of all support sales made in conjunction with LOVE FOR SALE.

But the Internet...gee, where is the money? It's basicly a "15 dollar" sign-up fee and you type the night away while in your "alone" room hooking up on the LOVE THREAD.

Not much money is made via the Internet. Therefore because it's low-priority MONEY, why not? It's easy. No problem going after the NeT as the criminal for DATE RAPE sources.

IT looks like they net has been targeted by the "i have nothing really important to do today" legislators as an evil empire and they are going to strike it out by legislating it into the ground. It represents no specific interest-group who are on the list of financial contributors to their "re-elect me" campaign.

Summation: i guess we have found a new scape-goat for RUSSIA as our enemy.

Now it's the INTERNET. The Internet has taken over the focus of the future "Joe McCarthy's of Congress" who are now out to SAVE America from the freedom which the Internet represents and they cannot understand as essential to a free society.

The Internet is the new COMMUNISM.

We are now being Internet-icized and the leaders are scared it may grow beyond their ability to control. yes, as in China and Vietnam and Malaysia and Korea and other third world countries whose dictators fear "freedom of discussion" the Internet is being controlled.

What the leaders cannot control they fear.

It's no different in the USA than in China or any of the others trying to take control of what the people will or will not read on their own time in the privacy of their own abode.

they will invent all sorts of "what if's" to bring it under the control of their agenda. Look at "children to save from the INTERNET"....bias opening in a server near you.

In the USA we just use politicians to save us from ourselves. In the China's of the world the proletariat tries to save them from being found out.

is it not the same thing, the same coin, just different sides.

question mark.

Introducing the new, then improved, the best thing to control since Joe McCarthy was at his best and the USA was at it's worst by what the government officially did to people's lives.

We are about to enter this same "twilight zone" with the saviours of our society going after those damn "internetiasts"

bill conduit

On 25 Feb 1997 07:05:17 GMT,
in the newsgroup rec.radio.scanner,
scott467@aol.com (Scott467)
from AOL http://www.aol.com thoughtfully posted:

> I recently bought an old Regency MX3000. Does anyone have instructions or
> know how to use. Any ideas?

Yup! I'm Listening to one right now!

It follows the "Regency" programming style (mostly).

First of all, on this particular model, you cannot access a
channel directly (ie: <Manual> <1> <2>), you have to press
<manual> repeatedly to step to the desired channel (there's only
30 of them!).

Entry:

To Enter a frequency:

<manual> <X> <X> <X> <.> <X> <X> <X> <enter> <X> <X>

To enter 162.55MHz in ch 5, press

<manual> 1 6 2 . 5 5 <enter> 0 5

Channels below 10 must be preceded with a "0"

Lockout:

To lock/unlock-out a channel, IT MUST BE IN SCAN MODE! Enter in
the channel number to lock out (it toggles).

To lock/unlock channel 20 press:

<scan> 2 0

To lock/unlock channel 1 press:

<scan> 0 1

Search:

To search a range of frequencies, enter:

<manual> <search prog>

1 6 2 . 4 <enter> <lower> (the "1" key)

1 6 2 . 6 <enter> <upper> (the "2" key)

<search scan>

Press <search scan> to continue scanning if a undesired signal is received.

Note: The scan limits are very loose. It's sensitivity is only rated for the normal operating bands (Low, High & UHF). You can program it to scan/receive down to 1MHz, or as high as 819.99MHz, but it generally craps out below 28MHz and above 530MHz (this is *not* an 800 MHz scanner). If the PLL cannot achieve lock, it displays "error". Reception drops off near the edges.

The useful range on mine seems to be:

28MHz-53MHz

136MHz-185MHz

400MHz-530MHz

General info:

If you goof-up while entering a frequency, press <manual> to back out.

Pressing <delay> (the "." button) toggles between hold and delay modes.

Pressing <speed> during a scan slows the scan speed.

The keypad only lights up in the "night" mode.

By now, you have probably noticed that this unit has an obnoxiously loud beep. If you are "electronically inclined", I can tell you how to quiet it down. It just requires a resistor to be added.

Detector output:

The detector output is pin 10 of the 18-pin "600-565-1" chip, or the orange "D" jumper wire next to it.

It is a decent little radio: good selectivity and it has a "helluva" set of lungs (a 4" speaker and a 2W amp). BUT, it does cause interference to other radios (especially SW), and itself, and the squelch could be a little "crisper" (I have not investigated that yet).

An external antenna is highly recommended. A "back-of-the-set" antenna will pick up it's own radiated noise. Most of the noise is processor generated and is radiated by the keypad.

Hope this helps!

Cheers,

3355. AR8000 and Optolinx

Newsgroup: rec.radio.scanner
Date: 1997-02-25 00:00:00 UTC
From: "Scott A. McIntyre" <scott@whoi.edu>
Message-ID: <3312D03C.6201@whoi.edu>
Source record: 205985

I'd like to talk with someone who has used the Optolinx interface on an AR8000. I finally got it working last night (after I plugged the Opto into the right serial port, D'oh!) but noticed that when using the AR8000 there is a noticeable "flicker" to the sound as it scans and even when it is paused on a station.

This is ONLY when it is under remote control.

It's sort of as if someone is speaking through a fan, you know, that sort of high speed choppyness that you get?

My hunch is that this is due to some problem with interrupts on the PC side, I've been using the AR8000 connected to my Macintosh for data download and upload without a problem for over a year, but it is possible that this problem was there all along and the mac programs simply didn't notice these pauses.

Also, it didn't do it when I was actually remotely controlling the radio on the Mac...only on the PC.

If this sounds like anything anyone has heard of, I'd love to learn more...

thanks!

Scott

Have been using it for over 6 months and I'm happy with it.
I am using it mainly for VHF/UHF and have no noise problems.
I have a discone antenna on the roof.

It's more comfortable to use than stand-alone scanner.
(I used to have AOR 3000A before.)

Since length of an antenna makes quite a bit of difference in the
tuning of it, I'm curious what length your whip was -- surely not a
108-inch full wave CB whip. What freq range did it improve, and what
did it do to the other frequencies (VHF and UHF)

Hello to the OBSESSED.....

Now for $14.95 a month you will received a 60 minute tape of real live cell phone conversation, not your run of the mill "I'll stop and get bread and milk on the way home Honey." but real life dramas like "I think I'll take the Bronco out and...." or "Yes thats the ticket Newt."

No need to worry ever again about getting that elusive mod for your scanner, join the Club and each and every month you will receive a 60 minute tape of the best Cell conversations money can buy, and it is all perfectly legal,,, belive me please do not Question this, it is legal, you purchase your tape directly from the Church of the Remote Cell Interceptions, they by circumventing the new legislation.

If you order NOW you will also receive Cells of the 50s and 60s FREE yes FREE, OH BE STILL MY HEART... what an offer and were not done yet Ed from Publishers Clearing House (a devoted follower) will be showing up at you door with our most coveted artifact,,, the BIG EAR a one ton statute of a BIG EAR made out of recycled now useless scanners, What a deal... What a deal... and to the first 7 million subscribers you will receive 45 minutes of DECODEDATIONS to soothe and relax you, yes Acars, Pocsag, MDT, DTMF,CTCSS, all professionally mixed and SterioOfied for your enjoyment. Wow you won't leave home without it, Got to get it , got to love it, turn it up, turn her on (yes it is good for that too)..

Got to go, were working on our new state of the art DIGITAL SPREAD SPECTRUM CDROM, soon to be in a store near you.

>with frequencies and here they are: What is TRUNKED POLICE FREQ'S? What is

Trunked radio systems use a set of frequencies (usually in the 800 MHz
band) and are computer controlled. At any given transmission, the
system will change the frequency in use based on what is available
from the set.

>a REPEATER? and what is a INSTANT? also, how many digits do you have to

A repeater is (usually) a permanent transmitter and tower. Signal is
sent to it from a low level transmitter like a hand-held. The signal
is immediately amplified and re-broadcast on a different frequency.

I don't know what an Instant is.

>enter? On one of the freq's pages there was a message that said you can
>listen to your local radio stations with your scanner, why someone would I

Only if your scanner is capable of recieving those transmissions.
Yours is not.

>(PRO-70) it says "FREQ. RANGE 29-54, 137-174, 380-512 MHz" I've tried
>entering a 8xx.xxxx freq. and it came back as an error, can I use those?

You will only be able to directly recieve the frequencies the unit was
designed for. The 800 M falls out of your range.

Mark

The truth as I perceive it to be.
Your perception will be different.

Stopped at the local Franchise store, saw the release notice on the new discone which will replace the current model, the new one has a vertical element like the Diamond, for enhanced lowband performance TX and RX, same price as the current model. Should be a winner.

Also saw the picture of the new HTX204 dual bander, looks like they might have something there, the release listed quite a few really great features, the Franchise stores should be able to do these at about 350 or so.(Suggested list 399)

I would just like to take a minute and thank everyone who responded to my questions. On 2/23 I bought the PRO-70 and played around for the day, after I read some of the messages I got, I realized this was a pretty plain scanner so I decided to trade it up to the PRO-62 (Freq. Range 30-54, 118-136.975, 137-174, 380-512, 806-823.9875, 849.0125-868.9875, 894.0125-960MHz) which I feel is a much better radio!

I found alot of good freq. pages on the web, I'm sure most of you know where they are but if you don't, send me mail and I'll send you the URL.

Again, Thanks to everyone!

Hi:

I am looking for any frequencies for the NJSP. A divisional map
would also be appreciated if one is available. I am looking for any info
on the NJSP radio system, vehicle identifyers, etc. Thanks in advance.

E-mail me any responses at Anthonye1@tiger.uofs.edu

Nobody said you can't monitor cordless phone calls.

==========
TECHNICAL QUESTIONS AND ANSWERS
==========

PRELIMINARY NOTE: The FCC says it is illegal to modify scanners to
receive the cellular mobile telephone bands. Therefore, I do not
offer that service and I do not do the work. Please don't ask. If
you choose to modify your own scanner for full 800 MHz coverage,
that's your business, but be aware that you could be liable for civil
sanctions of $10,000 or more, according to the FCC.

021: How do I restore cellular in my scanner ?

Forget it, pal. It ain't going to happen. The TDDRA
Act of 1994 expressly forbids the manufacture or
importation of "easily modified for cellular" scanners
after April, 1994. Manufacturers turned to putty and
removed the cellular programming from the scanners'
CPUs altogether. Sorry, it's not possible. But here
is a list of all those pre-1994 scanners of which I am
aware that are capable of cellular restoration:

PRO-2004 BC-855XLT *3 Regency 4030
PRO-2005 BC-200XLT Regency 1600
PRO-2006 BC-205XLT
PRO-2022 BC-760XLT *4
PRO-2026 *2 BC-700XLTA *4
PRO-2027 BC-890XLT *4
PRO-2030 BC-950XLT
PRO-2032 BC-2500XLT *3
PRO-34
PRO-37
PRO-39
PRO-43 *1
PRO-46 *2 *5
PRO-51 *2
PRO-23 *2

Note 1: Date of Mfg code 1A4, 2A4, xA3, xA2 (label in
battery compment), or no "A" in the serial no.

Note 2: Date of mfg code 1A4, 2A4, -A3, -A2 (label on back).

Note 3: Date of mfg code must not end in the letter "D", except for OAID.

Note 4: Date of mfg code must not end in the letter "D".

Note 5: Units with date code of 5A4 can tune cellular in 30 kHz Steps using a keyboard entry sequence.

For instance, PRO-43's imported before March, 1994, are modifiable, while some brought in during March and all thereafter are impossible to modify. Date codes of any -A2 or -A3 and only 1A4 and 2A4 are assured of being modifiable. 3A4 and up probably aren't.

The above list does not include those scanners that were naturally capable of receiving the full 800 MHz band, without modification, some of which include:

J.I.L. SX-400 AOR-950 Icom R-7100
Regency MX-4000 AOR-1000 Icom R-1
Regency MX-5000 AOR-1500 Icom R-100
Kenwood RZ-1 AOR-2500 Icom R-9000
Uniden BC-800XLT AOR-3000 Icom R-7000
Yaesu FRG-9600 AOR-8000

Some of these radios, if still current, had the cellular removed by the factory after April, 1994. There may be possibilities of restoring cellular in later models of the AR-8000, AR-3000, and ICOM radios by replacing an EEPROM or reprogramming one, but that is beyond the scope of this FAQ, and in general, should not be counted on.

==========
022: What about cellular restoration ads for post 3/94 scanners?

Yup, I do see magazine ads to "restore" cellular or to "unlock 800 MHz" in newer scanners. Gasp! This is almost a deception. See, they're advertising the "VD" mod.

Virtual Downconversion - better than a venereal disease, but not by much. To my way of thinking, it is an inferior method of "unlocking" the cellular bands because:

A. They're not really unlocked. VD is a trick of turning off one oscillator and turning another one on. Typically, they set the scanner to the 400 MHz band, and then turn off the normal 400 MHz Local Oscillator and turn on the one for 800 MHz to make cellular receivable on the 400 MHz display.

B. There is no logical correlation between the actual cellular frequency and the displayed frequency. It varies from one

radio to the next, but suppose 880.000 MHz comes in. It might be received/displayed on 432.6775 MHz. Duh....??

C. The total cellular bands of 823.950-849.000 and 868.950-894.000
are not available by this method. In fact, only a small portion
of one or the other (often not both) is available, like maybe 10-20 MHz of the total.

D. There is no 30 kHz stepping. You're limited to the default "rules" for the band in which the cellular appears.

E. The exact results of the VD mod, generally described above, depend on the scanner. Results vary from one to the next. None are what I'd call "good" or even acceptable.

The only good thing that can be said for the VD mod is that it is the ONLY way to get any cellular at all from post March-1994 scanners. So, the advertisements that you see are not exactly "fraud".....but you sure don't get much for your money, either.

==========
023: Are any mods available for my scanner ?

Shooooey, dude, you have the wrong impression about scanner modifications and hacking. Mods are not "available" in the sense that they can be found on a store shelf, or laying on the top of someone's mind who can tell you in so many words or less how to turn that "Snakebite" scanner into a fire-breathing, rip-snorting behemoth of a Turbowhopper.

All scanners can be modified for something; generally a dozen or more things. But only a few scanners have anything written about them in detail. And you have to know where to LOOK. You can't just up and ask for them. Well, you *can*, but you won't get any substantive replies.

It takes me several days to several weeks and sometimes MONTHS to work up and write about a hotshot mod for a decent scanner, and after THAT level of effort, it's not possible to make it "available" off the tip of my fingertips. Continue reading below. There are answers to your question........

==========
024: Where can I find mods for my scanner ?

You can't. There are only a handful of scanners ever made that were worth solitary, focused research and development, specifically for that scanner. Those scanners include the following:

PRO-2004 PRO-2005 PRO-2006 PRO-2035 PRO-2042
PRO-2022 PRO-43 PRO-34 PRO-37 BC-200XLT
PRO-26 PRO-39 BC-3000

You may find occasional articles, files, and "mods"
expressly for other scanners not mentioned above, but
they are the exception to the rule. Start by looking
through the file section on my BBS (619) 578-9247, and
peruse quick-links to other sites from my WWW HomePage:

http://ourworld.compuserve.com/homepages/bcheek

My BBS has hundreds of files on a wide array of radios
and you are welcome to peruse the list. My homepage
has quicklinks to hundreds of other sites that may contain
a file or two on a generic "Snakebite" scanner.

Now here is the problem: I am one of the few, (if not
the ONLY) engineers fully committed to scanner mods.

Yet, there are over 700 scanners on the historical list
now. It is physically impossible for me to dedicate
attention to any but a few, and I have to choose those
owned by the greatest numbers of people who can support
my efforts and help me to pay the rent; put food on the
table; and educate the kids.

That small list of scanners above reaches out to tens or
hundreds of thousands of owners. There is no time left for
me to work on "SnakeBite" scanners that have very little to
offer, even after hours of hard work! But take cheer and
read on.......

==========
025: So you mean there are no mods for my scanner ?

More or less I mean that, yes. But, that's not to say
it can't be modified. It can! It's just that there is
nothing published for it; nothing in the way of step-by
step instructions with graphics, photos, and details.

No one would go to the time and trouble, you see?

An engineer who is capable of designing super-hacks
for that "SnakeBite" scanner is not going to own one!
Instead, he will own one from the above lists, one that
is eminently capable of some very powerful modifications
in the first place.

Now I said your "SnakeBite" can be hacked. It can.

But you are more or less on your own in the sense that
I cannot direct you to a "shopping list" of mods from
which you can pick and choose. There is no such list.
Any hope for you is to figure out what you want to do,

and ask me a specific question.

I can give you a few answers in advance:

No.

No, your "SnakeBite" is probably not capable of cellular;
extra memory; additional bands of frequencies; and things
of that nature that pretty much require factory design in
the first place. (See ahead for Memory Modifications)

Yes.

Yes, your "SnakeBite" is probably capable of a few analog
modifications along these lines: (You wanted a list?)

1. Tape Recorder Jack
2. Automatic Tape Recorder Switch (beats VOX!)
3. Extended Delay
4. Tone Decoder-Rejector Countermeasure
5. CTCSS mod
6. S-Meter
7. Scanner-to-Shortwave Interface
8. Carrier-On-Indicator
9. Audio Improvements
10. Beep volume or disable
11. Squelch Improvements
12. Remote Controller
13. Baseband audio outputs
14. Event or "hit" Counter
15. Shielding of plastic cases
16. External DC power
17. Improved Adjacent Channel Rejection
18. Speed up of SCAN & SEARCH modes

Then, maybe...depending....on the scanner.... the following
digital and/or esoteric enhancements.....???

19. Interfacing to a computer
20. Subsidiary Carrier (SCA)
21. Extended Memory to 25,600-channels & up
22. Cellular restoration
23. 54-88 MHz restoration
24. Data/Tone/Noise Rejection

==========
026: So how can I do some of these mods?

That's a problem. No one has written them up for your
"SnakeBite". About the only way I can think of is to
get one or more of my three books and a subscription to
the WORLD SCANNER REPORT. Research and study up on the
mods we've developed for other scanners, and then

compare the procedures for that specific scanner to
your "Snakebite". Often, when I write up a mod, I give
hints on how to apply it to other scanners.

Also, if you ask me specific questions, I can give
specific answers. If you ask me "how to do a memory mod",
I'll just refer you to something already in print or
published somewhere. If you are doing a memory mod and
run into trouble, then I will help you with that trouble.

==========
027: Memory mods? How can I increase the programmable channels?

That depends on what kind of memory storage system is
used by your scanner. There are three kinds:

1. On-board CPU RAM (Random Access Memory)
2. Static Random Access Memory (SRAM)
3. EEPROM Electrically Erasable Programmable Read Only Memory.

The first kind is most prevalent and there is no way to
expand that kind of memory. It is, however, usually
limited to scanners with 51 channels or less of programmable
memory. 100-channels and up are usually done by methods 2 or 3.
So your first step is to determine what kind of memory is used
by your scanner.

EEPROM memory is expandable, but very difficult under
most circumstances. SRAM is the easiest and offers the
largest expansion capabilities. For example, the
PRO-2004, PRO-2005, and PRO-2006 can be expanded to
25,600 programmable channels (and more)! The PRO-32,
PRO-34, PRO-37, PRO-39 & PRO-2022 can go to 12,800-channels
and beyond. The BC-760XLT, BC-560XLT, and a few others
can be taken to 6,400 channels and more. The PRO-2035
and PRO-2042 can be taken to 16,000 channels and beyond.

My Extended Memory Modifications are amply documented
in excruciating detail in my books and in the WORLD
SCANNER REPORT, complete with diagrams, photos, and
many pages of instructions such that most casual
hobbyists who know a soldering iron from a tire iron
can do the work. This kind of mod is not suited to
being given out in an e-mail or a forum message in so many
words or less, so you will need to acquire the instructions
before doing the work.

==========
028: How do I tell a SRAM chip from an EEPROM from CPU RAM?

If you can't do this on your own or after the below
explanation, you are probably not a candidate for such
a wild adventure at this stage of your hacking career.

Most CPUs hold a small amount of RAM (random-access-memory), sufficient to store anywhere from 10 to 50, maybe a hundred channels or so. This is the case for most scanners, so there is no way to increase that memory. Fortunately, there are two other methods of RAM used by a few scanners that offer possibilities for expansion.

EEPROM: The least common and least expansive is EEPROM (electrically erasable programmable read-only-memory). The PRO-43, PRO-26, BC-2500XLT, BC-200XLT, BC-100XLT and BC-3000XLT, for example, use EEPROM programmable memory. It is possible to expand EEPROM-type of memory, though not by such huge proportions as the SRAM type. EEPROMs are usually tiny little chips with 8-pins.

SRAM: A handful of scanners use a separate SRAM (static random-access-memory) chip for storage of frequencies and custom channel settings. It is this type of memory that can be easily and economically expanded by factors of 2, 4, 8, 16 and even 64 times the original volume! Scanners known to employ SRAM memory include the following:

PRO-2004 PRO-2021 PRO-32 BC-760XLT
PRO-2005 PRO-2022 PRO-34 BC-950XLT
PRO-2006 PRO-2032 PRO-37 BC-590XLT
PRO-2035 PRO-2042 PRO-39 BC-600XLT

There may well be other scanners that use SRAM memory, but either I forgot about them or don't know. If you're curious about your scanner's potential for memory expansion, you can just about forget it for those with fewer than 100-channels. The CPU's RAM easily handles 10 to 100 channels or so. If your scanner is not on the above list, but has 50 or more channels, then look over its schematic diagram and parts list or scrutinize its Logic/CPU Board for any of the following types of SRAM chips:

uPD446G-15 TC-5517CF-20 LC-3517BM-15
CXK5864BP MB-8416-20LPF

or something similar, disregarding the last few digits and letters. A SRAM chip is generally characterized by a rectangular shape with 24 to 32 pins, each of the longest sides holding half the pins. An SRAM chip in a schematic diagram will be characterized by eighteen or more of its pins going straight to the CPU chip. Any chip with less than 24-pins is not likely to be an SRAM; neither is any chip in a square format. SRAMs are rectangular (DIP or SMT) with 24 to 32 pins. Pinout notation of SRAM chips will include mystic codes such as:

A0, A1...A9, R/W, CE, I01, I02...I08, OE, etc.

==========
029: My scanner has an SRAM; how do I do the mod?

Get the published instructions for Extended Memory Mods using larger SRAM chips. Start by reviewing the free Table of Contents and Index to the World Scanner Report where you will find articles on memory mods. Get at least one of my books to supplement the WORLD SCANNER REPORT. The ULTIMATE SCANNER book is probably the best choice.

The Table of Contents and Index to the World Scanner Report can be found on my HomePage and FTP sites as well as on my BBS. They're also contained in my product information file: PRODINFO.ZIP that I can send by e-mail upon request, or which can be downloaded from my homepage, BBS, and FTP sites.

Since all SRAM chips are much alike, my instructions for one scanner will apply to all, and not be that difficult to follow, provided you can find your SRAM chip in the first place.

==========
030: Do you do scanner modifications like memory mods?

Sure. Contact me privately and we can go from there.

==========
031: I'm not interested in all your mods - just one. Will you photocopy the information for me?

Sorry, no. My publishers own the copyright to my books and my company owns the copyrights to material published in the World Scanner Report. It would be unethical, illegal, or both, for me to do that.

If your budget is tight, you can in many cases get basic information for free from my BBS or from me via e-mail and the hard core stuff for $5/up by purchasing specific copies of the World Scanner Report. It is not always necessary to buy my books in order to do the mods. On the other hand, my published mods are NOT the sort you find on most BBS's and Internet sites with a few sentences or paragraphs and maybe an ASCII drawing if you're lucky.

My mods are detailed; well documented; and have excellent graphics, including schematic diagrams, photos, and illustrations. This kind of work does not come for free and I make no bones about it. On the other hand, there is no charge if all you want is how to do simple mods like the cellular mod to the PRO-2006.

==========
032: So how do I restore cellular in the PRO-2006?

So long as you understand that it is illegal to do that, here's how:

1. Remove the top cover of the scanner.
2. Look down inside the front panel behind the #3 key
of the keyboard, and clip the exposed leads of the
two coppery colored diodes standing on end. One
restores cellular and the other gives a FREE 25%
speedup of the SCAN function.
3. Replace top cover.

See, that's the kind of stuff I can provide for free.
And I am happy to do so. I do not work for free for
days on end, paying out of my pocket the high costs of
photography, graphic arts, and computer operations with
sweat dripping off my brow..... There is a difference.

If you don't believe it, then grab a few free files off
my BBS and others, and some from the Internet.........
and then invest in a copy of the World Scanner Report
or one of my books.... See for yourself.

==========
033: How can I improve my reception capabilities?

Easy - maybe. Just increase the height of your antenna.

Each 10-ft increment of added height can yield an
apparent "gain" of 3-dB. For scanner signals, 3-dB of
difference can be all the difference between excellent
reception and none at all! There is no substitute for
height of the antenna when trying to receive signals
outside your immediate geographical area of more than
a few miles. VHF and UHF signals weaken dramatically
as they travel along the surface of the earth (ground-
wave); much more so than the spacewave that travels
a couple of wavelengths and more above the earth's
surface. Low antenna heights intercept the spacewave
of only very close transmitters, and the groundwave of
all others. Yes, the quality and type of antenna makes
a difference to a station's reception capabilities, but
the single most important factor is the height of the
antenna, regardless of its quality and type.

==========
034: How can I install the military aero band in my scanner?

You can't, and that's that. If your scanner came with the
military aero band (220-400 MHz), then you're Fat City.
If it did not come with it, there is no way under the sun
of "restoring" it. You can't restore what ain't there.

==========
035: How can I modify my scanner to follow trunked systems?

You can't, and that's that. For one, it would be illegal to do that according to the ECPA of 1986, but two, the data formats and software of trunked radio systems are proprietary and copyrighted by the manufacturer or vendor and this information is not available to the public, nor even to technical shops. Each trunked system is as different as night and day with respect to all other trunked systems, even from the same vendor. It is possible for the astute hobbyist to gain some skill and fortitude in following trunked system conversations. These techniques are scattered around in various written works, from books, magazine articles, and prefaces in frequency directories...to text files on various BBS's and Internet archives. These techniques, hints, tips, and kinks cannot be recited here in so many words or less. One good starting point might be the preface material in any recent edition of Radio Shack's POLICE CALL books. But in a word, you cannot alter your scanner to follow trunked signals.

LATE NOTE: Uniden has announced their TrunkTracker series of scanners that are designed to follow certain trunking systems. Keep an ear posted to the forums for news of these potentially interesting scanners as they come to market. If Uniden is able to "get away" with marketing the TrunkTrackers in the USA, it might inspire hardware hackers and software writers to figure out retrofit TrunkFollower modifications for certain scanners. For now, this issue seems blatantly illegal and we have to wait and see if Uniden is challenged by the government and/or the trunked system vendors.

==========
036: My PRO-2004 has problems, first mild and now severe. It has been repaired several times. Can it be fixed?

There is a distinct possibility your PRO-2004 has problems with defective solder joints. Back in 1986, there was a production run of the PRO-2004 manufactured with a defective wave soldering machine. At first, it was only marginally defective, but it worsened and degraded with time.

The result, by the time the malfunctioning machine was discovered, was that many defective PRO-2004's had been shipped to market. Some immediately failed within the warranty period and were repaired or replaced. Others didn't fail until after the warranty expired, and were either repaired or junked. Some didn't fail for years.....

Failures appear to come in waves.....periodic rashes. Defective solder joints are a serious problem, because the radio can be fixed only to the extent that it is broken. Repaired solder

joints today have no bearing or relationship to those headed for failure in a week, a month, or a year. There is no economical way to repair them all in one fell swoop. A PRO-2004 with defective solder joints is very likely to develop more problems with the passing of time. There can be no guarantees against subsequent related or unrelated failures.

With that in mind, yes I do such repairs, but I cannot guarantee that other failures won't occur. Costs of repair can be high, and I would estimate the first repair tag to be $100 plus return shipping. I know, it's a bum deal, but I can't do any better than that except to offer to buy the unit for my repair parts bin.

I pay $25 plus shipping for defective PRO-2004's in reasonably clean condition. (No basket cases....) You might consider this as an alternative to continued repair bills.

==========

037: Can my scanner be interfaced to a computer for remote and automated control, as well as for programming of the memory channels by the computer? Can the interface acquire data from the scanner and send it to the computer?

In a word, yes. Most scanners "can" be interfaced to a computer for one-way control and automated programming of the memory channels. It is probably not worth the effort and cost for most scanners, but it can be done. These scanners include:

PRO-2004 PRO-2005 PRO-2006 PRO-2035 PRO-2042 PRO-2022
PRO-34 PRO-37 PRO-39 PRO-43 PRO-26

Probably quite a few others are possible, but.......???

There are three scanners that are capable not only of the one-way mode of remote control and automated programming, but also of a "data acquisition" mode where the scanner sends its display (channel, frequency, bank, mode, delay, lockout) and other data to the computer for automated logging and data processing. These scanners are the PRO-2004, PRO-2005, and PRO-2006.

Several companies make scanner/computer interfaces, including:
Optoelectronics - Datametrics - COMMtronics Engineering

Each interface has its own unique characteristics, advantages, and limitations, but all are "good" in the sense of freeing the operator from much of the labor and drudgery of scanning. The Optoelectronics and Datametrics interfaces are generally limited to the PRO-2005/5 and PRO-2035/2042.

A "roll your own" computer interface was published in the World Scanner Report, V2N1-V2N6. Another more powerful one was published in my 3rd book, THE ULTIMATE SCANNER (Cheek3)

==========

That's it for now. I will keep this FAQ updated. If you see things that need to be added to it, by all means, let me know. If this FAQ fails to address your question(s), then hit me with 'em again, but be specific. And be detailed with symptoms and observations if you need tech support on mods or troubleshooting and diagnosis. Use e-mail if you can.

Eric,

Check my web page at http://www.voicenet.com/~jcardani/sjscan.htm

follow to New Jersey State, then to New Jersey State Police

Frequencies, unit identifiers, talkgroups in the standard Motorola
format or the Uniden Trunk Tracker format, and codes.

Remember this is a Motorola SMARTNET IIi trunked system and you will
not be able to follow most conversations unless you have a trunk
tracker or similar equipment!

Joe

See what happens when the FCC lets their guard down for one moment!

From Yahoo news:

Monday February 24 3:03 PM EST

Woman Says Internet Date Led To Rape

NEW YORK - A New York businessman was arrested over the weekend and charged with beating, raping and sodomizing a woman he met on the Internet, police said.

A police spokeswoman said Paul Krath, 46, met the victim, a 41-year-old woman from Syracuse, N.Y., through an Internet chat room six weeks ago.

After weeks of electronic chatter, the woman traveled to New York Friday to meet Krath. "They had dinner and conversation at his Greenwich Village apartment and during the evening he allegedly raped, beat and sodomized her," the spokeswoman said.

The woman was "in severe pain" when she approached police for help and was treated at a New York hospital. Krath is to be arraigned in Manhattan Criminal Court on Monday.

3397. Using OS456 & OS535 signals for MDT, Trunker & PD-203?

Newsgroup: rec.radio.scanner

From: ae826@leo.nmc.edu
Message-ID: <33123748.0@zeus.moa.net>
Source record: 206045

I wonder if anyone out there who has the Pro2006 w/ OS456 has considered that the scanner already has a tap to the descriminator. I don't have the specs on the CIV port, but I bet the signals we all want are on the pins of the serial port already. Further, I bet with a simple pin converter, we could tap the signal into the Trunker.exe and MDT.exe as well as the PD-203 software.

Does anyone have intimate knowlege of the CIV port on this device. I'd like to only have 1 cable between my scanner and computer if possible and it seems that it COULD be done. I know there are a great number of us who have this configuration, I bet some of these programs will eventually be integrated into scanner control software!

I must admit, I don't have the expertise (yet) to even say how to do it, but if anyone can point me in the direction of CIV interface info, I'd appreciate it.

Just trying to stimulate some hardware exploitation,

Tom N8LFZ

>Ummmm, please do'nt yell at me to, but, where do we post binary files >related to this group? I am asking sincerely because I really wish to >know to avoid posting them in the wrong group.

Well, there is unfortunately no really great answer to that. The most "correct" newsgroup as far as I know would be alt.binaries.misc (with a post here directing people to look there.) However, alt.binaries.misc is mostly a garbage dump. Best thing if you can do it is probably to put them on a web page or FTP server.

Usenet is just not a very efficient mechanism for distributing files, when only a few of the recipients are interested. The 160 or so people who downloaded the exe's from my FTP page during the week they were posted is minuscule compared to the number of news servers carrying these newsgroups.

The source code posted here for the MDT and trunk radio programs is wonderful stuff, but without a compiler and a debugger you are not going to be able to do much with it beyond play with it a little. They never claimed to be complete production applications. So, anybody serious really has no need of exe's posted here anyway.

I agree. I personally don't care that the issues are late. The fact is, you will get them. The articles are great fun and sometimes very humorous. If you want realtime stuff, then read other mags. My guess is that the subscription number is relatively low to this mag. These guys can't waste all their money on postage. I can't wait for the day when you just receive CD's in the mail, instead of all this paper to hang on to.

Hey Nuts and Volts, if you're out there: Why not offer a realtime mode of delivery, at additional cost, for these guys. Something like FedEx P1, or UPS 1 day? How about it?

Scanner World used to sell these Super Converters. It kinda depends on how bad you want to listen to cell phone. If you want to listen 83.99 bucks worth, then sure, its worth it. They are kinda bulky though, that shouldn't bother you though. But if you have a double conversion scanner, you can still hear cell phone. It will be an image, and you won't hear the whole cell phone spectrum, but it will probably be just as fun.

An early version of the Ramsey kit, the SS-7, did have a circuit which
allowed varying the frequency. This "clarifier" circuit included a
variable resistor. One very annoying problem with this model was a
"whine" in the audio passband.

The unit has since been completely redesigned and marketed as the
SS-70. While it does not have the terrible whine of the -7, it also
does not allow for easy tuning. It never did make sense to me, given
that not all speech inversion products use the same inversion
frequency.

Out of the box, the -70 did not do what I initially hoped it would. I
was able to "tune" it by replacing the crystal inside. After some
trial and error, I discovered that a 4.75 MHz xtal did the trick
fairly well. It wasn't perfect, but works well enough.

If your unit is "close" but not good enough, try a crystal on either
sideof the one included with your unit.

Good luck

Georgia uses an old duplex system. With rare exception, the Georgia State Patrol does not use repeaters. Cars talk to base on one frequency, and bases talk to cars on a different one. Also, cars can talk to one another on the same base-to-car frequency.

Statewide, Base to Car and Car to Car is 154.680. Car to Base is 154.800.

Another pair that works just like this, that the state patrol as well as county sheriffs use, is base-car/car-car on 154.905, and car-base (and base-base) on 154.935.

In the Atlanta metro area, GSP also uses 155.910 (repeater output).

Good luck

Fred Zuschlag, ko4yu

3420. ## Search for handheld radio or scanner with external frequency control and optional dual UHF receive

Newsgroup: rec.radio.scanner
Date: 1997-02-25 00:00:00 UTC
From: techno@actcom.co.il.NOSPAM
Message-ID: <E6564s.FyJ@nonexistent.com>
Source record: 206068
Cross-posted to: rec.radio.amateur.equipment,alt.radio.scanner,alt.radio.scanner.uk,rec.radio.scanner

Hello all,

I need to build a system consisting of TWO UHF (400-500MHz) scanning receivers, whereas one receiver quickly searches the band, and once it has locked to a signal (squelch triggered), will program the other receiver to another frequency (at a fixed frequency distance. This is called "reaction tuning"). This is needed for example for finding repeater frequencies. Since it might not be possible to implement this with ready made devices, another option would be to have the 1st receiver output it's currently received frequency to an external (serial?) port, where it might used to program the 2nd receiver, with some possible frequency calculation done with an external computer along the way. Since there are dual band handhelds capable of receiving two frequencies at the same time (such as the FT51, TH79, etc.) and external frequency control, it might be possible to implement such a system with a dual band transceiver too, if it could support frequency input/output and fast search too.

The most essential requirements from the first (controlling) receiver for this application are:

1. FAST SEARCH rate (around 100 steps/second or better). fast SCAN and large amount of memory channels are not a must. additional search steps would be an added bonus, but 12.5KHz search step is a must.
2. Support for search limits (upper/lower bounds, with automatic roll-over at search limit).
3. Reception of the 400-500MHz frequency range. Extended range would be a bonus.
4. Can OUTPUT received frequency (once squelch is triggered) to external port (preferably RS-232, but can also be CIV or any other standard).

The 2nd (controlled) scanner must support the folling features:

1. Can accept (INPUT) a frequency change command (preferably RS-232, but can also be CIV or any other standard).
2. Reception of the 400-500MHz frequency range.

The two scanners need not be the same, but it certainly is possible that the same model will meet both requiremnts. It's also possible that a "smart" dual receive transceiver (with external frequency in/out) can be adapted to this use.

It should be noted that the above requirements exist in various scanners (fast search and external frequency in/out), but I have not found them to exist in a SINGLE model (i.e externally programmable scanners such as the AR8000 don't search fast enough, while fast scanners such as the BC-220XLT don't have the frequency I/O).

Of course, with all other issues being the same, a lower cost solution would be prefered.

Any pointers to such scanners/handhelds would be truely appreceated. Thank's!

regards,
techno

From: rick <rick@netgsi.com>
Message-ID: <331276D6.25CA@netgsi.com>
Source record: 206072

I have recently installed the os456 board in my Pro-2006. It seems to be working correctly. When running it with the supplied versions of Radio Manager and Scan Star i am having some problems. In scan star I cannot run the scanning window with the spectrum analysis or any other window. Documentation with the demos is of course lacking. With both demos I'm only scanning at about 18 channels per second. this is much slower than the out of the box 26 per second. I've tried increasing baud rate of the serial port and reflected changes in the programs. When I doe this I lose computer control. Are these problems with the demos? Would like to know what programs others are using with this mod. Like windows 95 platform but will go dos if a particular program warrants it. Im using a 75 pentium to interface with the scanner. thanks Rick

3427. What scanners/antennae have the longest range(RR freq)

Newsgroup: rec.radio.scanner
Date: 1997-02-26 00:00:00 UTC
From: student@sed.uga.edu
Message-ID: <student-0601041446000001@sedlab1.sed.uga.edu>
Source record: 205826

I have a radio shack Pro-50 and a 2-foot portable antenna mounted on the windowsill of my apartment, but only receive a range of about 5 miles for the railroad frequencies. What scanner has the longest range? It does not have to be portable, and I am only monitoring railroad frequencies. It does need to be programmable, but the number of channels scanned is not important(10 will do). I am looking to stay under $200.

Also, what antenna has the longest range for railroad frequencies(160-162 range)? It must be moveable and under 3 feet tall, to be mounted on a windowsill. I am unfamiliar with the price ranges. If it doesn't make much of a distance in the range received, I would prefer one that can be placed on the roof of my car. Thanks in advance.

3428. Why cell images are better?

Newsgroup: rec.radio.scanner
Date: 1997-02-26 00:00:00 UTC
From: bich@scd.hp.com
Message-ID: <5f238d$hpl@hpscit.sc.hp.com>
Source record: 205827

I just tested a Down converter from Ramsey, and after a long struggle with the setup I was able to tune in cell freq at ~ 480Mhz. I was in for a major disappointment: I can only hear one side of the conversation! When I monitor cell freq images at 890 Mhz and up most of the time I can hear both side of the conversation. Can a scanner guru explain to me why cell images are better?

3429. Need Crystals

Newsgroup: rec.radio.scanner
Date: 1997-02-26 00:00:00 UTC
From: n5xdn@pcok.com
Message-ID: <5f22ne$3oj$1@okanogan.brigadoon.com>
Source record: 205828

Hi All,
I picked up a Bearcat Thin Scan Model: BC Four-Six TS at a radio swap meet for a cheap price. I would like to find a source of crystals for this radio. I know it is an out dated scanner but an extra easy to use scanner is handy to have. The IF of this scanner is 10.8 mhz. The crystals in it now are stamped with the freq, the letters BCT and the word JAPAN. I'm willing to trade the 3 crystals in the radio since the freqs. are useless to me. They are 154.325mhz, 154.755mhz, 154.845mhz.

What I need is:
146.970
150.750
155.565
155.340
154.340
155.850
155.235
154.190
154.130
044.700
044.900
444.700
462.300
462.500
and more. This is only a 6 channel radio but I like to be able to set it up for different types of scanning. If you have some crystals for this radio that are not on my list email me to see if I could use them any how.

I also would like to know the 6 volt power and charge plugins configuration like tip/positive or negative.

Thanks,
dB

what
> happens.

You are right about the computer polling the scanner and creating a kind of
thumping noise. I have seen this in the AR8000.

> So far, my experience with the available software has been less than
> encouraging. I'm beginning to think direct computer control of the radio

I have found that computer control of the AR8000 not anywhere as satisfying
as
a PRO-2006 and Opto-456 combination. Besides the annoying thump, the AR
is still less than a third of the speed as the Opto and does not have the
DCS,
CTCSS, and DTMF decoding.

The only redeeming quality I have found with the AR computer interface is
that I can
keep my frequencies in an Excel spreadsheet. With a VBA macro I can create
a file
and send it using Hyperterm to program the scanner.

3440. Unanswered FT-50 Questions

Newsgroup: rec.radio.scanner
Date: 1997-02-26 00:00:00 UTC
From: lem@datatel.com
Message-ID: <856997663.23822@dejanews.com>
Source record: 205839
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.scanner

Greetings,

I normally don't send unsolicited e-mail, but based on all of my reading
I and still have FT-50 questions.

Would anyone with knowledge please take a few minutes and see if you can
answer any or all of my questions. (Some are elementary and some are
very technical, but any help is appreciated.)

My radio has the following serial number sequence: 6L130292 (but I've
been told this doesn't matter)

My Radio has "freeband" mod: (de-solder blob "1", remove resistor "A"
above blob 1, pwr on with lamp/knob,press FW, pwr off, pwr on with
lamp/ptt/knob, change BAND=A* to BAND=FREE, pwr off, pwr on)

My Questions"

1. Why cant I get my radio to go back into "BAND xxxxxx" anymore, it did
it one time during freeband mod? "I am interested in going back to see
what the A1, A2, and A3 settings do, and if I should have
createdtemplates for each of these? I assume two of them are EURO(s) and
one is US configuration of the radio, if so does anyone have the template
files (.TPL) for the three of these they could send me (if my assumption
is wrong - - what are they and are there more, and can you send me
template files for all of them) ? "I am also interested in getting to the
INTERNAL SYSTEM ALIGNMENT so I can adjust the signal strength meter. I
knew I read this somewhere, but YAESU said there was no such capability,
help me???

2.
What are the various differences in the versions of the ADMS-1C software?
(for example version 1.05 won't let you enter out of band frequencies
[200-300 and cellular] even though you have done the FREEBAND
modification, but version 1.04 will allow entry of out of band
frequencies). Would having an older version(s) of the ADMS-1C software do
anything for me, and which versions should I get my hands on (and how can
I find them) ?

3.
How can you get the all VFO and HOME memories programmed into the radio
from the ADMS-1C? Am I doing something wrong, are these a part of a
template file (.TPL) versus a radio file (.RDF) ?

4. Would someone be kind enough to send me the following .TPL files via the regular mail (address below): • a standard US template [pre modification / out of the box configuration] • either or both European templates(EURO.TPL) with a desc of what each does do • any other templates that do anything off-the-wall, neat, or special [send with descriptions]

5.
Can someone tell me what each of these lines in my WIN.INI file do for the ADMS-1C?

```
[FT-50 Programmer]
AllowAnyFrequency=0
Calibrate=2909
Com=1
DataDir=C:\YAESU\FT50
TemplateFile=C:\YAESU\FT50\FREEBAND.TPL
UseTemplate=1
```

What happens if I start changing values of "AllowAnyFrequency", will that open it up so I can do the out of band frequencies via the software, and if so what value do I use (I have tried 1 and null, neither work) ?

What does the "Calibrate" do, and what are my options for values here?

6.
Is there a users guide or some detailed instruction manual that anyone has written for the ADMS-1C?

7.
Is there a power on button sequence that will reset the microprocessor without clearing memories?
Is there a power-on-button-sequence that will reset the microprocessor AND clear the memories?
What are all the different power-on-button-sequences and what do each of them do?

8.
Is there a mod for receive in the 25-75 MHz range ?
Will the radio receive VHF low band if I add 45.1x 2 to the desired frequency ? (ie. 52.250+90.2=142.450)

9.
Is there a mod for TX (or RX) in the 220+ MHz band ?
Is there a mod for TX in the 800/900 MHz bands ?

10.
Has YAESU printed new (revised) manuals for the FT-50 yet, I heard they were going to ?
Is there an advanced users manual yet (similar to what ALINCO did for the DR-599/600) ?

11.
What happens when you turn off the CPU clock shift function ?

What would this be used for, scanning via some sort of computer like
computer aided scanning ?

I receive my new Icom R-10 on Tuesday and returned it the dealer today.WED

Thank god they have a good return policy. GROVE ENTERPRISES.

The radio works good from 50MHZ up, but from 500khz thru 30mhz it like not having a receiver at all.

There is a 50,000 watt AM station 10 miles from my home and I just barely could hear it.KGA 1510 khz. there is another station on 790 that I could not hear at all.

I thought that I had got a defective unit. I compared the R-10 with my Sony SW100. Thw SW100 out performed the R10 like you would'nt beleive.

I connected my outside ham ant to the unit. wow, intermod, static and guess what. i could hear FM music on 20 Meters and 80 40 15 so on.

I really feel that Icom does not have a product.....and they have created a monster for them selfs.

If you want to try one of these units out anyway.....make sure the dealer you purchase it from has a very good return policy....

Let me know what you think about it..... hope this will save you some $$$$

In order to get the radio back into the "master set" (my term) mode, You will need to reset the "a" vfo to 144.000 and the "b" vfo to 440.000, no pl, no offset on either. hold down the top knob, ptt and lamp, and power up. you should see band+free. If you turn the knob, you should see the settings hssi, s1, s9, and so on. these will allow you to set the squelch sens, s meter and so on. if theat is what yaesu told you, they are lying. btw, If you power up with the vfo, the settings are for vhf. try switching to uhf and changing the specs. I set low pwr 1 to 10 mW to drive transverters.

The radio will tx + rx in 220. tx pwr is 22 mW, rx sens is 3 mV for 12 dB sinad. pretty poor, but great for testing used 220 ht's at flea markets. No 800 tx, But the second harmonic of 440 freqs shows up quite nicely on a service monitor (hi).

> 11.
> What happens when you turn off the CPU clock shift function ?

I don't know about out there in California, but I do know...

A laser detector won't give you any warning. They are WORTHLESS. Lasers are pinpoint and instant. Laser guns even have a sighting system on them (where as Radars are pointed in a general direction). A lot of companies are making a killing from selling useless laser detectors. They will go off, IF the detector is hit directly with the beam. If that is the case, the cop already has your speed and you know that you are going to get stopped (again, IF it goes off). The typical radar guns may give you and advance warning... depending on location, the operator's skills, ect....
The times a radar detector actually help are less than you would think.
I have operated radar for 2 1/2 years (various makes/models, all of the "K" band). Some radar guns work better than others, and they have their limits.

I am an airline pilot, so I travel most of the time. I have been using a Trunktracker to keep my luggage from getting lost or stolen. There's a new model from Uniden: the BCT235XLT Trunktracker. I can't wait to get a hold of one! New features, in addition to an enhanced GPS, will include 220W technology. As you may probably imagine, we will be able to virtually electrocute (Zap!!!) via cordless remote anybody stealing our luggage.

On a recent trip to Zimbawe, I read in a local magazine (Zafari News) that 100 Truntrackers have been ordered, before their release, by the Kalo Zoo. They will use them to keep track of the rare Ebonictus elephants during the Spring Mating Exodus to nearby cities!

This new gadget will cost about $300.

Source record: 205878

Phil Knoll <aknoll2@mail.idt.net> wrote:

>Anyone have any info on the Icom IC-F40LT, good bad or whatever?

Hello Phil,

F40LT is a 99 channel UHF portable transceiver. The model is nearing 3 years old. It is a full 5 watts, three freq ranges cover government UHF to T band.

The radio is keyboard programmable aka the U16, also can be PC programmed which is much the preferred way.

Each channel has an 8 digit alpha nametag to tell you what is programmed there.

Radio is fairly small, quite rugged, and Mil 810 and Intrinsically Safe certified.

It can be programmed to operate simple or full featured depending on your requirements.

Does tone and digital coded squelch, and DTMF with DTMF memories.

An excellent radio; we have sold several hundred with 3 years of history. A *lot* of people want to trade up from Motorolas.

Slow or rapid drop in charger operates from 110 volts or 12 VDC.

Many other features, please go here to read a product review I wrote on the radio. This is ICOM's website.

http://www.icomamerica.com/land_mobile/review.html

Prices are going up an average of 12% at the end of February.

We have good stock on them. Holler if you need one.

Be careful if buying a used one as there was an earlier version with same model # which was not fully 99 channel alpha capable and had some other minor problems. Thousands of these are still around. As an authorized ICOM service center we will upgrade older F30LT (VHF) or F40LT (UHF) to latest specs FOR FREE. Complicated mod, involves adding extra memory chip and rewriting the firmware.

Radio also is available in a 16 channel version without keypad and readout, called just F40, or F40 "simple".

It is a very nice radio, pretty much the ultimate 2 way portable with many many programmable features if you want to use them. If not you can ignore them and they don't complicate things.

Hope this helps.

Steve

From: cbombino@aol.com
Message-ID: <19970226040901.XAA00484@ladder02.news.aol.com>
Source record: 205881

Does anyone know what the Road/Dispatcher frequencies are on the old RF&P railroad (Richmond, Fredericksburg, and Potomac) now that the CSX railroad has taken it over? This is the line that runs from Alexandria, VA to Richmond, VA.

I know the old ones were 161.550 (Road and Disp. to train) and 161.490 (Train
to Dispatcher). However, I have a book titled "Compendium of American Railroad Radio Frequencies" 13th edition published by Kalmbach in 1995 and it
shows that 160.410 may be used as the Train to Dispatcher channel.

If anyone lives near the railroad and listens on a scanner who knows this information, I would appreciate it.

Thanks -- Chris B.

Although this isnt a SCANNER, yes, I agree.. great radio! However, be
careful, it's96 channels, no big deal, but one dealer here had someone
think it was 99 channels, and when he got the 96 channels.. he was
upset (geez, loser!)

>Each channel has an 8 digit alpha nametag to tell you what is
>programmed there.

Considering most radios are 4 or 5 alpha.. I'm impressed!

>Radio also is available in a 16 channel version without keypad and

In message <3312D03C.6201@whoi.edu> - "Scott A. McIntyre" <scott@whoi.edu> writes:

:>I'd like to talk with someone who has used the Optolinx interface on an
:>AR8000. I finally got it working last night (after I plugged the Opto
:>into the right serial port, D'oh!) but noticed that when using the
:>AR8000 there is a noticeable "flicker" to the sound as it scans and even
:>when it is paused on a station.

I don't have a lot of experience with the scanning software, but I've seen the effect you're describing. It was quite prominent with one program. My experiments indicate the command that causes the AR8000 to report the current signal level has a side effect of causing the audio to cut out momentarily. The program in question sends a constant stream of this command so it can display a signal meter (which was grossly inaccurate during my tests). If the software you're trying has a signal meter, try turning it off and see what happens.

So far, my experience with the available software has been less than encouraging. I'm beginning to think direct computer control of the radio sounds a lot better in theory than it is in reality. At this point I'll be happy to find a program that will help me manage the memory banks and reliably download updates to the radio.

Perhaps you can help with a question I have about the Optolinx. I purchased a competing product and am less than enthused about it. I'm particularly concerned about the clearly fragile connector on the radio end of things. How sturdy is the connector used by the Optolinx? Any other impressions on the Optolinx?

Fine, I have no problem with that.

>I honestly think
>posting a 400 line binary is a lot better than some of the shit I've
>seen go through here, mainly the cheeks/Mackey/whoever else arguing
>and flaming everyone else.

Undoubtedly, but that's not an excuse. OK, I admit I overreacted.
Hell is frozen and the files are back up on my FTP directory
(ftp://ftp.netcom.com/pub/so/source). Based on feedback, the
non-ziped exes are gone, and I added the original message and source
code to the zips. I'm only trying to help. I still say that anybody
seriously interested needs to be able to compile it for himself.

I flamed one side of why the .EXEs should not be posted to the
newsgroup; now let me roast the other side a little:

I took the source code that was posted anonymously to the newsgroup.
I looked at it, not enough (unfortunately) to understand every bit
twiddle, but enough to know that it wasn't anything malicious. I
compiled it and put it on my FTP directory. I can, if necessary,
prove that the file there is exactly what I said it is.

Anybody who takes that file and distributes it further is taking just
a little bit more risk with it than I am. You are trusting me not to
have inserted malicious code into the .exe. You have no way to tell
if I did or not. What are you going to do when somebody blames some
problem on the file you gave them? You would be much better off
getting the source and compiling it for yourself.

Anybody who gets such a file from some unknown third-hand channel and
passes it on is just reckless. Losses from evil programs distributed
over the net is already easily in the millions of dollars; read
newsgroup comp.risks for details. That's not counting viruses.

Anybody who downloads a .exe file off the newsgroup (without a PGP
signature or something like it) and runs, it is a fool. It is just
too easy to forge a post; you really can't know where it came from.
Usenet is not a suitable way to distribute software.

In my own humble opinion the problem in this situation IF TRUE is not the
Net but the woman and the A**hole she went to meet.. If the woman is
stupid enough to meet a blind date at his apartment and not in a public
place I can't feel too sorry for her.. The guy should be in jail if he did
what is stated since he would seem to be a predator or some sort of sicko.

3488. Re: Is this what's called AMBULANCE CHASING?

Newsgroup: rec.radio.scanner
Date: 1997-02-26 00:00:00 UTC
From: Jeffrey Miller <jfmil@ix.netcom.com>

I always thought ambulance chasing referred to lawyers trying to get
clients by following an ambulance or showing up at an accident scene.

No, the disenfranchized element of society who don't do much
with themselves in the outdoors just decide that people who
go to situations where ambulances precede are bad people and
put them in a bug-me-not jar.

that means the press and insurance adjusters get their scorn
for just being at a scene where ambulances are at.

lawyers used to do this, but now they hire agents to do it
for them. People who will rep for them and give them a good
attorney to talk to. From what a lawyer tells me this is
a frowned on activity in their association code of ethics.

funny thing though: people get upset that people make money
by being at accident scenes...that is their main gripe.

sort of like a portable popcorn vendor who just happens to
show up at a major fire that takes over four hours to contain
and this guy is selling popcorn and coke to thirsty people
watching the event....

Clean the battery contacts and make sure they are making a
good connection.

If you've ever connected your PRO-2004 to 12 VDC but accidentally
reversed the polarity, it can damage the low battery sensing circuit.
I've seen this before.

You can buy a service manual and check it out or
send the PRO-2004 out for repair.

The Celltower to cellphone frequencies are 869.04-894 Mhz. The
cellphone to celltower frequencies are 45 Mhz lower. That is, since
cellphones are true DUPLEX, the cellphone transmits on the lower
frequencies, and receives on the higher frequencies. The celltower or
cell site transmits on the higher frequencies, and receives on the lower
ones.
Since the lower frequencies have cell phone conversations, they are
blocked on US scanners as well as the upper ones.

Standard produces two products with the above description. The one you saw was the Standard AX-400. This is not sold in the US. I was told by Standard US that the unit would be available here in the Spring, but have not seen it advertised yet. It is sold in the UK by Javiation, and it is marketed as the WELZ WS-1000 by Diamond Antenna:

http://www.demon.co.uk/javiation/index.html

It is about $500 US.

The other unit is the C508A which is a 280mW dual band Amateur Radio handheld. It is an excellent scanner as well, but has 100 memories rather than the 400 of the Welz unit. It basically goes upward from 100 Mhz receive with some TV broadcast segments omitted, with 800 Mhz frequencies included (cell blocked). It is an impressive unit.

It is available from Amateur Radio vendors in the US for about $280.

I blame, in part, the lack of active radio scanner promotion by scanner manufacturers for the stream of stigmatizaton being hoisted over anything and anyone even remotely associated with a police scanner.

You'd think, if only to preserve the lucrative market, that the ad zecs of these manufacturing companies like Uniden and Realistic, would cite positive scanner uses and applications. The last ad I saw for a police scanner on TV was back in the 70s when Bearcat ran that ad where a newspaper reporter beat his coworkers to the story by using a police scanner.

Why did the scanner manufacturers roll over dead on this?

I 've been subscribing to and reading Nuts and Volts since 1982. They have evolved from a want-ad rag into a full blown magazine. Yes, they have some eccentric behavior, giving away copies at tradeshows and certain distributers, etc. Not everybody lives in an area where free access to the magazine exists. I live in Oregon and only know of two or three places where you can buy it. I have always been treated with respect and courtesy when dealing with them. I missed a copy once and a call to them resulted in a prompt replacment. If you have a personal dispute with them, write them a letter and explain your displeasure. I've been buying and selling electronics via their magazine for 15 years. I know they're not perfect, but they're the best resource of their kind that I've found to date. CONSTRUCTIVE feedback to them should only result in a better publication.

Hi name here is Rick. I have a Bearcat 890-XLT for sale.
It is in execlent condition. Comes with Box, manual,
Antenna and wall transformer. The specs for the scanner
are as follows.

200 Channels
10 Banks
7 preprogrammed NOAA Weather Freqs.
7 search bands
Scan Rate: 100 channels per second Turbo Mode
20 channels per second normal Mode
Scan delay 2 seconds
Audio Output 3W

Freq. Coverage:

29. to 54. Mhz NFM
108. to 136 Mhz AM
137 to 174. Mhz NFM
216 to 224.9875 NFM
225 to 399.9875 AM
400 to 512. NFM
806 to 956. NFM less cellular band

Also has an event counter, a VFO mode with large tuning knob.
A WX alert alarm that is activated by NOAA weather alerts.
And is CTCSS compatible, if the optional board is installed.
I will take $200 for this scanner.

If interested send e-mail to: kc4kin@geocities.com

Unless the cop is investigating something (dispatched call or on view suspicious activity)...and you refuse to give him the info he requests. If you aren't sure what he is investigating, or what he saw/heard to give him the indication something might be amiss, and you refuse to talk to the "damn cop," you might be surprised what happens next. I suggest you tell him to "stick it," roll up the car window and drive away next time and see what he does. You'll no doubt get an in depth view of the workings of police procedures, and he will surely give you the full benefit of your law enforcement tax dollar.

FYI, not only is the In-N-Out operation a class act in and of itself, the burgers are the only ones I've ever found that are actually good when served cold! How do I know this? Well, they usually bring a truckload or two of burgers to the Tournament of Roses Parade every year for the folks who are working, including the ham operators. By the time we have a free moment or two to get out and grab a bite, they have pretty much lost their heat, but they still taste wonderful!

Just my US$0.02 worth....

In case anyone is interested, I have a Pro-51 and a Pr0-46 for sale

Both units are BRAND NEW in the boxes, with rubber duck antenna, manual,
and nicad batteries. Both have cell freqs. Date codes are :

Pro-51 7A4

Pro-46 4A4

Asking $100 + shipping for the 46, $150 for the 51

In answer to your first question you want to look at the sensitivity of the
scanners..I don't know if a higher or lower should be your criteria. Also
for $200 you could get a Radio Shack PRO2037 or I believe a PRO29 (on sale
from 350 or so) which will give you lots more sensitivity than the 50.

On the antenna I would say a Marine Antenna would help tremendously and if
you can't get one or it's too big try a 2 meter Mobile antenna that should
help also. You would want an antenna tuned to the band you are listening to
or as close as possible to that band. If possible get the antenna up higher
like the top of a bookcase, on a high shelf, or on top of your computer
hutch (if you are using one).

3522. Laws, Cellular, Scrambling, etc.

Newsgroup: rec.radio.scanner
Date: 1997-02-27 00:00:00 UTC
From: mbg1897@aol.com
Message-ID: <19970227194601.OAA13801@ladder02.news.aol.com>
Source record: 205727

This post may be a little long, but there are several things I have wanted to
say for a while regarding scanner laws, cellular laws, scrambling, etc.

Regarding Cellular phone calls, I do not have a problem with requiring that cell
phones be blocked on scanners. It's illegal to tap land-line phones, so I do not
see a problem with it being illegal to "tap" cell phones either. Before you flame
me, notice that I said "I" believe. But, I also think that cellular users don't need
to be so boneheaded to think that noone can hear them talking !

One thing that I do not like at all is Scrambling by law enforcement and public
safety. I am a firm believer that being able to hear the radio communications of
these officials keeps them responsible and responsive to the public. For instance,
let's say it takes officers an hour to respond to an IMPORTANT call a mile away.
That would probably be less likely to happen without Scrambling, since the

public WILL know about it and will likely question the officers' actions. However,
with scrambling, the only people to know about the lack of response would be
the police themselves. I don't know about you, but I want my police officers
to STAY publicly responsible.

Of course, scanners ARE used by some for purposes that I do not agree
with. For one, some criminals, but by far not all criminals, use scanners while in-the-act.
However, if research were done, I would bet that far many more scanner listeners
help to catch criminals than criminals use scanners to committ a crime.

I do realize that, sometimes, our police officers' lives could be put in jeopardy
by a gunman armed with a scanner :). For that reason, I would not have a
problem personally with being required to have a license to carry a scanner --
or perhaps not allowing convicted fellons to purchase scanners.

Also, there are those idiot scanner listeners who go to the scene of the crime,
accident, etc. I say that, if they have no legitimate reason for going to the scene (such as being a volunteer firefighter, reporter, etc.), that their scanner should
be seized and they should be fined or thrown in jail. Their is enough congestion
around fire scenes or accidents without rubberneckers. Rubberneck at home, electronically, and don't go to the scene.

Well, that's just about it. I have had my 5 cents worth. All-in-all, I think that
scanners are a good thing because they can help those who are sworn to serve and protect us in-line. (Not that there aren't many WONDERFUL officers
out there anyway). Also, scanners help us to be aware of what is happening
in our communities. If a BOLO were put out about a robbery suspect in a green
pinto, and I saw a green pinto come flying by me, I would call the cops. If I
hadn't heard the BOLO on my scanner, I would probably just yell "idiot" at the
driver and not think another thing about it.

That's it.

In the area I live there are Planes or Helicopters that will get your speed
as well as the cop with the radar gun. I am not sure if a detector would
help on a Helicopter/Plane getting your speed. The radar detector might
help if the Police aren't using Laser radar. Laser can't be detected from a
far enough distance for a radar detector to be useful.

A resounding "Yes" to privacy and also a resounding "Yes" to monitoring!!

Here's how:

Since I believe in my own natural right to the ownership of my body, I
also firmly believe in my right to demodulate ("monitor") all the radio
waves that pass through it.

I also believe that people have a right to complete privacy in their
communications.

I can reconcile these two deeply held beliefs through the use of encryption.

If you want to keep your communication private, I have no beef with you:
just buy a device that transmits in a format I can't decode.

To people who claim that unbreakable encryption should be illegal
because criminal activity would be able to be hidden from law
enforcement, I say there must be a definite distinction made between
talking about a crime and doing it. No communication per se, including
encrypted communication, should ever be illegal. (Jamming and cell
fraud are examples of potentially communication-related crimes that
absolutely should be illegal, but they are not communication per se.)

-David.

Hi Bob,

you might want to check out the following frequencies:

457.5375
457.5875
467.8500

I think the 457.5375 may be used by the remote barcode readers.

Bob

Nuts and Volts is for buying and selling stuff. Their articles are mostly trash, with lots of bad information. Remember however that they were originally all ads. I subscribe for that reason only and I am generally pleased. Buying them for "information" is probably a bad idea.

>Why in the world would you have done a foolish thing like that? :-)

Drew,

Two reasons. First, I don't care about listening to cellular, and second, my car was already wired with an antenna and a power cord with a plug. The pre-94 units had the power cord permanently attached to the radio. This way I can remove the radio when I go out of town and leave the car parked at the airport, or any other time security is an issue.

Fire Rescue Offers Citizen&#65533;s Fire Academy

Palm Beach County Fire-Rescue will be commencing its first Citizen&#65533;s Fire Academy in March/April 1997.

The Citizen&#65533;s Fire Academy provides County residents with the opportunity to accompany rescue workers as an observer after first learning what the job of a firefighter/paramedic is all about. Additionally, participants are given the opportunity to take part in home safety surveys, fire extinguisher training, Cardio-Pulmonary Resuscitation, first aid instruction, and ultimately feel the experience and the heat of a controlled live structure fire demonstration. The Academy is open to residents 18 and over. The class is tentatively scheduled to meet one evening per week for 9 weeks.

For applications or for further information, please contact Battalion Chief Steve Jerauld at the Palm Beach County Fire-Rescue Training and Safety Division located at 50 South Military Trail, Suite 200A, West Palm Beach, FL 33415 or call (561) 233-0010.

What are the codes used by the Minneapolis PD, St. Paul PD, and the subburbs
in Minnesota.
Thanks Dale

You should look in the Digikey catalog and maybe even check out their
oscillator chips. I heard they offer 4.43 Mhz (parallel).

73 Magazine has ads; Nuts and Volts also.

Most military air comms are in the 225 to 400 mhz band. May be AM or narrow FM. Although I'm sure there are others, I can recomend the Yaesu FRG9600 and ICOM R-7000 R-7100 and R-8500s as having the capability.

> at Radio Shack for $300 + tax.

Not me! I got lucky and found the PRO-60 at RS on sale for $199.99!!! 47% off, which compared to the PRO-26, I decided it wasn't worth $200 more for some more sensitivity & more frequencies...

> and radio setup might be better.

Other problems I've found with doppler units: When you are really close
- or the transmitter is very strong,
the pin diodes get swamped, the coaxial cable starts to leak and the
reading becomes useless. Also, the
audio that drives the doppler can't be common with the speaker of the
receiver otherwise noise in the
car will skew the readings badly.

Your method sounds a little more cut and dried. I've tried
triangulation
but when you're in a hurry it's a time-waster. You get to know how
close you are
using two guys and two radios. The entire group I was with were all
really
good. None of them used any sort of plotting though.

Driving a fast car helps too!

Go tell the judge that....and then show him how you do it.
You will find youself behind the gray bars with bend-over-Billy!
You folks need to keep up with the laws....it is now illegal to monitor
ANY phone communications. This includes cordless and cellular.

From: Tommy V C <tommis@matrix.uti.com>
Message-ID: <33164488.7CFF@matrix.uti.com>
Source record: 205758

I need some help please. I own a pro2035 and just got a bc9000xlt. The problem is that on the 9000 I have tuned in freq 155.67MHz & 155.685MHz Both very active channels in my area and the 155.685 comes in on the 155.670 channel and when it does you can not understand it. the 155.685 is the strongest channel in the area.I tryed the att switch on the 155.685 and that does not help. I also tried to keep turning down the squelch and that does help but by the time it does it is to low to pick up other channels. Is ther something wrong with this scanner or what? the 2035 does not have this problem but the 9000 seam to be more sensitive. thanks with any help!

3554. more channel on pro-2006

Just purchased this very scanner at Radio Shack for 119.99. The most
desirable date code is "11A93" and can be found on the back lower left
of the radio. It is cell modifiable
by simply cutting a jumper inside. Works!

Yaacov Simon wrote:
>
> Is there any problem in using a scanner on a commercial airliner?
Yes.
Is it
> Legal?
Nope, violation of FAA regulation.
Would it cause any interference with the plane's equipment?
It *could*, that's why the cabin attendants always say that at no time
during the plane's trip may portable am/fm type radios be used, and that
Gameboys and laptops & such have to be off during climbout and
approach. Try this: put your scanner on sometime, and let it run. Have
another scanner nearby do a search through the bands. You'll probably
hear signals on one from the other, confirmed by turning off the one
that's not hearing the signal. That's why the "Part 15" certification
is necessary; all oscillators radiate *some* signal, just like
computers, fax machines, and cash registers.
Would
> I be able to receive anything in or outside of the plane?
You might just hear the captain asking someone from Airport Security at
your destination to meet your flight and drag you away :)
Bad idea all around.

If all the activity you want to check is between 400-500 MHz, and if all you want to find is repeater inputs, is there a problem with just using the standard offset formulas? 406-470, input is 5 MHz higher than output, except for some regional differences, like Southern California ham repeaters, which are low in/high out. Above 470, the input offset is +3 MHz. Of course, 470-512 is only used in, I think, the 25 largest metropolitan areas, elsewhere it's for UHF TV. Or am I missing something more here? Oops, I'm assuming you're in the US here, too...

The fact that you could not here both sides has nothing to do with wether
you were listening to images or not. This is dependent on how the cell site
which you were monitoring retransmits the mobile uplink signal. Some cell
companies repeat the mobile audio back out the transmitter, some do not.

3572. Pro 60's for $199

Newsgroup: rec.radio.scanner
Date: 1997-02-27 00:00:00 UTC
From: aa186@freenet.akron.oh.us
Message-ID: <E68sHo.M8C@freenet.akron.oh.us>
Source record: 205779

Radio Shack sent me their latest brochure today in the mail. It has the Pro 60 in there for $199. It was on closeout for $249 prior to this. With the freqs. it gets and 3x conversion, you can hardly go wrong. Especially since the $199 is only $20 more than the also closed-out Pro 62 at $179.

Just wanted to post this in case anyone is considering buying a 60.

Mike

Jeff,

FYI, Jill Prince, Uniden's media director, told me last week that they were still making software changes to the radio and updating the owners manual to reflect the changes. If they are still making changes then I can't see how they can have applied to the FCC for type certification yet. I did ask Julius Knapp, director of the FCC's Equipment Authorization Division if the 235XLT had been approved yet. He could find no record of an application with that designation (this was about 10 days ago.) Jill said they still plan to ship by the end of March, so I'm not surprised that your wholesaler said that, but I think that may be a bit ambitious since it usually takes about 40 days for approval.

Of course, it's not your job to tell us how to run this newsgroup.

Why not just shut up, for crying out loud?!

How's that for a two way street?

If Radio Shack is going to claim in their commercials that they have
answers, and if they imply that they have the "correct answers", then
they better damn be sure that their clerks know those answers BEFORE
the are sent out of the nest to wait on customers... either that, or
have each trainee wear an "I AM AN IDIOT" badge until said training
is completed.

3576. Help -- Looking for Railroad Frequencies in Virginia

Newsgroup: rec.radio.scanner
Date: 1997-02-27 00:00:00 UTC
From: cbombino@aol.com
Message-ID: <19970227044000.XAA14716@ladder02.news.aol.com>
Source record: 205783

Does anyone know what the Road/Dispatcher frequencies are
on the old RF&P railroad (Richmond, Fredericksburg, and
Potomac) now that the CSX railroad has taken it over?
This is the line that runs from Alexandria, VA to
Richmond, VA.

I know the old ones were 161.550 (Road and Disp. to train)
and 161.490 (Train to Dispatcher). However, I have a book
titled "Compendium of American Railroad Radio Frequencies"
13th edition published by Kalmbach in 1995 and it shows
that 160.410 is now being used as the Train to Dispatcher
channel.

If anyone who lives near the railroad can verify these
frequencies (or tell me if some others are in use)
I would appreciate it.

Thanks -- Chris B. E-mail: CBombino@aol.com

Radio Shack have once again lower their prices on their scanners that
are on clearance...

I'm in Manhattan, NYC, so go search for the other area stores as well.

Pro-4035 for $199.99
I picked up the last brand new one in Manhattan.
these 2 stores still have 1 display model each.
67st and Lexington Ave. - saw it there, bought mine from there
103st and Broadway - not confirmed but it's in RS's computer.

Pro-46 for $49.99
Picked up the last one in Manhattan.
supposed to be one left at 103st and broadway, but they apparently
messed up their inventory, so no more in Manhattan

Pro-2026 for $119.99
Picked one up when it was $299 :-(and another when it was $139 :-)
All the display model I've seen can be modified for cell.
There are few of these left in Manhattan, the two store on Park Ave
have them, and one in the Boardway and 10th street or so store have
one (date code 11A3, modifyable .for cell and have detachable power
cord). The store on Park Ave South and Village lost their boxes, so
no manual and bracket, but they can order for you free...

This one is unconfirmed, but I hear that the Pro-49 is going for
$16.95
it's only a 10 channel scanner with a 2-digit display and does not do
800's

These are prices as of 2/26/97...
so try your area stores if you're interested in getting these or
others, and you can always ask them to search the region for what's
on hand at other stores.

Happy hunting... and clear signals...

> What a moron.

In all honesty my children wouldn't be that trusting..I'd teach her not to be a trusting person especially of someone she's never met and knows nothing about no matter what the person tells her online. I know I never trust people I speak to over the net and am skeptical of things most if not all people tell me and this is the way my children are brought up. Remember TRUST IS EARNED not automatically given.

Now I realize this might be politically incorrect but has anyone ever heard of taking resonsibility for yourself and your actions and not go crying "Government Please Fix this".. Of course this is the wrong attitude now a days it seems to be blame X for this or that problem without ever thinking hmmm could I have avoided this or done more to insure my safety?

As for the Moron comment... At least I have some brains and still use'em. Unlike what seems to me to be becoming a nation of Robots who go along with the PC thing and wouldn't dare venture an unpopular attitude or view.

As to why I didn't type out Asshole it's because I didn't want to offend anyone who might object to that kind of language. Not because it's PC but it is polite.. Ever hear of Ms Manners?

If you don't like it I really don't give a crap... Just wanted to respond in general to all Flames I might get from PC or Liberal Cry babies people on this subject.

Does anybody have a handle on the Portland, OR metro area frequencies?
Using Radio Shacks Police+ book is an OK start, but I seem to be missing
quite a bit of the trunked frequencies. I live on top of Bull Mountain and
would expect to get conciderably more reception then I do.

The hardware lineup is a Bearcat 8500, RS Discone, and 9913 coax.

Thanks in advance for any help you can offer,
Bruce.Bennett@tek.com

Not to pick either side of this argument, but just because you think a cop is bothering you for absolutely no reason doesn't mean it's true. Just because you don't know what his probable cause is doesn't mean there isn't any. If someone called about a person sitting in a car down the street that they thought was suspicious, and it turned out to be you, you would have to give your name and other relavent information ("relevant" depending on the jurisdiction). If you didn't, you'd probably go to jail. If you have nothing to hide, what's the point of being abrasive to the cop who is doing his job, checking out a person he was sent to check out by a call from a citizen? Next time it might be you calling about someone else.

>Thanks.. john

If my local K-mart store (in Montgomery, IL) uses radio for making
announcements, I haven't yet found their frequency.

But, I have found this K-Mart employs a simplex radiotelephone
autopatch on 154.600 MHz which connects to their PBX. BTW, the same
frequency is used by McDonalds across the street from K-Mart
and an Ace Hardware up the block so 154.6 is always hopping :-)

Sir,

Radio Shack is currently selling out remaining models of the Pro-2026 for $119.95. I know, I bought one brand new just two days ago. Check carefully and you can find pre-April, 1994 models that can still be cellular modified. My local store had two of them, although I selected a newer, unmodifiable unit.

How to tell the date? On a sticker on the back will be two numbers and a letter, i.e. 4A4. The first letter is the month, in this case the fourth month, or April. The letter means nothing. The second letter is the year. In this case, 1994.
3B6 would be March, 1996, and so on.

The changes in law should only affect software sales in that once the radios have been re-designed to prevent cellular restoration those people who intended to purchase the software solely for that reason probably will not, so sales may decline slightly. There is no direct prohibition on the software itself.

I'm quite fond of mine after only two days use. Initial impressions are that it is like all the other scanners/comm receivers that allow access to HF frequencies...they get the strong stuff and that's about it. I also don't expect it to perform anywhere near as well as a dedicated SW rig that is 5 times its size.
I have spent most of my time scanning VHF/UHF and familiarizing myself with its features. I plan to spend more time evaluating its HF performance soon and will post my impressions soon after.

Nobody wants you to give up your privacy.
Well,that's not quite true; I'm sure there are a few who want to inspect every aspect of your life... ;-)
Anyway, tyhe fact that you use a cordless (or cellular) phone doesn't mean you have to give up your privacy. It does mean, however, that you must evaluate your communications, to see if they even offer you any privacy that you can use.
Analog phones offer little privacy.
Cordless phones are, despite laws and the pressure of "civilized" society, listened to quite regularly. They are, in fact, radio transmitters, and as such, are available to anyone with a suitable radio, and that's alot of people.
Cellular phones (except those that are specifically designed with privacy
features like digital encoding, or frequency tricks), are even less secure, because they cover a much wider area than cordless phones. I like to say that using an analog cellular phone is even less private than holding a conversation on a crowded street corner, because more people are able to listen in.
To expect privacy in these situations simply isn't rational. It's like walking naked down the street and demanding that no one look at you, because you are naked, and you feel that's a private thing. Ain't gonna happen!
So, as I say, we don't want you to give up your privacy here, because, using analog radio phones, you have no privacy to give up.
I am well aware that laws, and even judges, have said that such radio communications are private, but they are merely thinking wishfully. Calling an open radio transmission private is like calling a table a dollar bill. Doing so may make you think you have a few more bucks, but the local Circle K won't accept them.

Privacy, by its very nature, cannot be granted by law, or by intent.
It can only be had by careful understanding of the circumstances of your communications.

Bill

I brought home THREE of them before I found one that would stay
together. The tapped holes for the rods were badly screwed up. The
last one has been up for over a year and seems to work ok, although, I
think that the small ground planes wor just as well, and cost about
1/8 of the cost of the discone.

Did they ever say, You've got esoteric questions, we've got encyclopedic answers? RS DOES train their people; there's a 12-part certification testing program that is required for continued employment. I know of no other company that requires their employees to know as much about their product line, let alone what the difference is between 75 and 52 ohm cable, what an MTSO is, how to hook up 70V multi-speaker public address systems, how to identify the value of an inductor in henries, what the difference is between satellite and surround speakers, etc. If you encounter an RS employee who doesn't know these things, they haven't completed their training. Is it your job to train them? Of course not! Then again, it's not your job to complain about them on this newsgroup, and you do that! Why not try to keep it constructive, for crying out loud?!

Well I was told to day by one of our Uniden Wholesalers that yes Uniden will ship trunktraker END OF MARCH.

this is good news , of course if true.
Others are saying that UNIDEN doesn't even have the scanner at the FCC to be approved.

I dont think they will block the 800mhz out,it would probably involve replacing
the CPU.I ve got one and the back says that it covers 500Khz to 1500 Mhz but I have never been able to hear anything between 540 and 800mhz except for the
the commercial Fm band showing up at 688 to 712 mhz.Even when I tune to the audio carriers of local UHF Tv stations I hear nothing.Anybody have different results?

Doppler is good until you start messing with multi-path (Where the
signal is bouncing all over the place). That is when a regular beam
and radio setup might be better.

>Two people and two handies work like a champ.

>visual distance.

This is a good technique, but a radio hooked up to an attenuator and
beam or quad is better. Use a compass and map, too. That way you can
plot the signal (Draw a line from where you are to the other side of
the map in the direction of the signal.). Don't forget to calculate
in your declination! HI. Do this 3 or 4 times, and where the lines

all intersect, is the area of where the transmitter most likely is.

>The key is that you need two people to make this work. Reflections play
>hell on VHF and
>UHF signals. So you and your friend should hop out of the car and stand
>20 or 30 ft apart.
>When you both get readings that agree - you've got a good direction (90%
>of the time anyway!).

Actually, one person can do everything very easily. But it is fun
with two people. Reflections DO play hell on these signals. Our
T-Hunting group here in Albuquerque bounce signals off of any of the
mountains in sight. For some reason the best signal is towards that
mountain...
Two rules in T-Hunting: ASSUME NOTHING and NEVER TRUST A T-HUNTER.

>Good luck - it's a riot!

I can't agree more! For more information on T-Hunting, please visit
the site below. This is my group's site and is one of the absolute
best around. The URL is:

gee green...
do you have this thing about the female sex?

what is it that makes you so "vitrolic"

question mark.

One could say that if little girls and teen-age girls and college-aged girls and those over 21 year olds were to assume their responsibility of going out with a date, then their paying for their half of the date would be a statement that "it's just a date".

It would signify that the girl or female recognizes her part in the equation and takes her pleasure in what is done for her own with her own money spent and in the company of this date.

this way there would be no "you owe me something" which is implied when females demand that the guy take her here and here and not here or there...and expect him to pay big bucks to impress her. then he feels used and wants to get even adn

her snatch is the next best thing to use as "collateral" for
getting his investment back.

When the female sex takes her part in the equation seroiusly
and accepts the guy as just a guy who she will go out with
for that occasion and nothing more. it is a straight contract
between the two and sets the tone of the evening or day.

It also allows the two of them to part should it not be such
a great idea once they realize how incompatible they are while
together.

It's not a sister thing or more. It's an attitude by the female
sex that permeates this unequal treatment by women of the male
sex.

Carlos Tomasio <ctom@napo.electrodata.com.pe> wrote:

>Please i need plans to modify my R-7000 for ear clean audio to process
>signals POCSAG.

Hello Carlos,

Here is how to pull discriminator audio out of your R7000 to use with various decoders that want clean audio. Use a short piece of shielded cable to the spare jack on the back of your R7000:

Best is junction of C131, C84 and R99 on I.F. board. Take output through a .01-.05 to block DC present at this point.

Not quite as high an impedance, but easier to get to from the top of the board, is junction of R97, R99, C87, C115, etc. This is the other side of R99 as preferred method. Again need to go through a cap.

If you have the service manual or schematic, these points geographically are between Q13 and X3, 1/2 way down and 2 inches in from the right of the schematic.

Be careful not to load the discriminator output too heavily, as it is a high impedance point.

Hope this helps.

Steve

What if one day -POOF!!!- all your scanners disappered. Your wife informs you she is putting her foot down, she's only going to allow you to have one handheld. What might that one scanner be, maybe a PRO 26, maybe a BC3000XLT, or maybe wait for the BC235XLT? (Remember you love your wife and can't bear to leave her.) So many choices, what one handheld would you own?

I have a RadioShack PRO-37 200 channel scanner for sale.
It is a dual conversion scanner that coveres from 30-960MHz
with all the usual gaps.

It comes with rubber ducky antanna, and a photo copy of manual
if needed.

Price: $150.00

If anyone is interested drop me a line.

My BC80XLT did not come with an adapter. I like the unit, though I just purchased a PRO-62. What I don't like about Unidens is that most of them take only their proprietary nicad pack, not alkalines, and that I have had to resolder antenna connections in two of them.

However, I have no quarrel over their performance.

First, Buy any radio that 1) covers the ARR frequencies. 2) That you can afford. Second, depending on where you live, a good outdoors antenna is recommended, preferably a Yagi that is pointed towards one of many local transmitter sites. You won't recieve both sides of a conversation unless your close to the tower and the train your trying to follow. Finally DON'T cross onto railroad property It can become an embarassing situation for you if caught.

Small, sensitive, relatively selective (though the Icom R-10 has a better front end). Audio Ok for size. Good battery life. Slow scanning/searching (if you thought the R10 is slow....). Can't easily lock out individual scan channels. 100 x 4 memory banks not too flexible. Auto freq steps on search can't be used in the US as they're designed for Euro bandplan (WS1000E0.

Sum: decent tiny radio for use as a second scanner. Probably the best miniature out there.

<snip>

This is the part that I have a problem with. I think this is a weak argument. Just because you live next door to me and I own a cordless phone doesn't give you the right to invade my privacy. Yes, the signal are in the air but you CHOOSE to listen and thus intentionally choose to invade my privacy. Remember, buying a digital or scrambled cordless phone hasn't always been an option and I don't think it should need to be. It seems to me to be all about ethics. I guess people do worse.

I have the following equipment for sale. No trades. I live in Columbus Ohio. I am a nonsmoker, and purchased all of the following new, have the boxes and manuals. Prices are shipped in the 48 UPS for cashiers check.

Kenwood TS-50s with CW filter and MFJ 100 watt antenna tuner. Radio has not been installed as a mobile. Used the radio on my nightstand for late night listening. Up Down buttons are faded as these were the most used. The rest of radio is in excellent condition. $500

Bearcat BCT-7 scanner. Excellent condition. Hears cell on image freqs as good as my AR8000. $100

Uniden BC890XLT. This one is not cellular modifiable. Good condition. $100

Email or call in evening 614-846-0700. Bob Mills, K8WX, was WM8P if you need to verify.

I Agree...and live in California near Silicon Valley. Have seen N&V as
give aways a couple of times...but usually have to buy it if I want it.

Can't blame a small magazine for giving away "promotional" copies to try
and increase their base of readers. Actually the more people that get
interested in the mag and subsequently subscribe or purchase it otc as I
do, means the more advertising they get, and they bigger budget they
should have for reviews or how to articles, etc.

Is anyone familiar with a Uniden SPS310T handheld 2 way? I can pick up a pair from my employer as they are from our old radio system for a real cheap price...One question...can these units be re-programmed to operate only simplex? They would be great when doing antenna work or running wires through the house. I assume they would have to be brought to a Uniden service center to be programmed...or do they need a new E-Prom burned? I've seen the radios but not the inside of them. Currently they operate in the 861-865 trunked band. Any info would be most appreciated via private e-mail. Thanks.....Bob

Hi all,

Anyone have one of these?

It's a 16 Channel desktop scanner, covering 29-54, 118-174, and
406-512, and it has a auto-squelch button.

It's made by Uniden, and I think it's equivalent to a Bearcat 145XL
(can anyone confirm this?)

Okay, mine is disabled... :-(
It turns ON, backlight is working, LCD is working, but no Audio and it
does not scan, but if I press SCAN or MANUAL it goes to the next
channel.

Something on the board is burnt, Does anyone have a schematic for it?
Anyone know where I can get this thing repaired or is it even worth
getting it repaired ?

Thanks,
Chi

Hi All,

Does anyone here have the schematics for a Uniden Bearcat 100XL scanner. This is a 16 Channel portable scanner, and it's not the 100XLT. Actually, all I need to know is the value of the resistor that is solder to the Center Lead of the BNC connector.

I had broke mine a few years back, and the markings on the resistor had flaked of and was not readable, so I've solder a 100 Ohm resistor in its place and it seems to work, but I'm sure the Antenna system is not longer tuned correctly. So if you can help please post or email...

The 100XL is my first scanner, I want to get it back to prime operating condition again... with the durable Aluminum Chassis, they just don't make them like they used to anymore...

Thanks,
Chi

Yes, it does, and as we shall see, yours is one, Tom.

>One common one is that 'scanners are illegal in
>XXXXX state unless you are a licensed ham/amateur'. When you read these
>laws you will find that most or all of them allow amateurs to have AMATEUR
>TRANSCEIVERS that happen to receive outside of the ham bands.

Yes, federal exemption does not permit states to disallow licensed amateur
radio operators from having ham transcievers. Nevertheless, the facts are
that "most of them" do in fact allow scanners - not transceivers but scanners,
if you have an amateur radio license. Since you mentioned reading the laws, I
have included some. Since you mentioned Minnesota and Michigan, I've
included those, as well as Indiana and Kentucky. Please read the following,
and pay especially close attention to the parts marked with asterisks:

Indiana Scanner Law

Burns Indiana Statutes Annotated (1995)
1995 Supplement, p. 54

Offenses Against Public Administration
Interference With Governmental Operations
s. 35-44-3-12 -- Possession of police radios

s. 35-44-3-12. Possession of police radios. -- (a) A person who
knowingly or intentionally:
(1) Possesses a police radio;
(2) Transmits over a frequency assigned for police emergency
purposes; or
(3) Possesses or uses a police radio:
(A) While committing a crime;
(B) To further the commission of a crime; or
(C) To avoid detection by a law enforcement agency;
commits unlawful use of a police radio, a Class B misdemeanor.
****

(b) Subsection (a)(1) and (a)(2) do not apply to:
[snip]
(6) A person who holds an amateur radio license issued by the Federal Communications Commission if the person is not transmitting over a frequency assigned for police emergency purposes;
****

Kentucky Scanner Law

Baldwin's Kentucky Revised Statutes Annotated (1993)
pp. 30-1, Crimes and Punishments
s. 453.570

453.570 Possession or use of radio capable of sending or receiving police messages restricted; penalty; enforcement

(1) It shall be unlawful for any person except a member of a police department or police force or an official with written authorization from the head of a department which regularly maintains a police radio system authorized or licensed by the Federal Communications Commission, to have in his or her possession, or in an automobile or other vehicle, or to equip or install in or on any automobile or other vehicle, any mobile radio set or apparatus capable of either receiving or transmitting radio or other messages or signals within the wavelength or channel now or which may hereafter be allocated by the Federal Communications Commission, or its successor, for the purpose of police radios, or which may in any way intercept or interfere with the transmission of radio messages by any police or other peace officers and it shall be unlawful for any car, automobile, or other vehicle other than one publicly owned and entitled to an official license plate issued by the state issuing a license to a said car, to have, or be equipped with such sets or apparatus even though said car is owned by an officer. Provided, however, the provisions of this section shall not apply to any automobile or other vehicle owned or operated by a member of a sheriff's department authorized by the fiscal court to operate a radio communications system that is licensed by the Federal Communications Commission or other federal agency having the authority to license same.
(2) Any person guilty of violating any of the provisions of this section shall be guilty of a misdemeanor, and, upon conviction, shall be punished by a fine of not less than fifty dollars ($50) and not exceeding five hundred dollars ($500), or imprisonment not exceeding twelve (12) months, or both so fined and imprisoned.
(3) It shall be the duty of any and all peace officers to seize and hold for evidence any and all equipment had or used in violation of the provisions of this section, and, upon conviction of the person having, equipping or using such equipment, it shall be the duty of the trial court to order such equipment or apparatus destroyed, forfeited, or escheated to the Commonwealth of Kentucky, and said property may be ordered destroyed, forfeited, or escheated as above provided without a

conviction of the person charged with violating this section.
****
(4) Nothing contained in this section shall prohibit the possession
of a radio by:
[snip - the following is from subsection (c)]
a person holding a valid license issued by the Federal
Communications Commission in the amateur radio service;
****

From the _Michigan Compiled Laws_:

Michigan Penal Code Section 750.508

750.508. Vehicles equipped with short wave length radio receiving sets
Sec. 508. (1) Any person who shall equip a vehicle with a radio
receiving set that will receive signals sent on frequencies assigned by
the federal communications commission of the United States of America
for police purposes, or use the same in this state unless such vehicle
is used or owned by a peace officer,
*****
or a bona fide amateur radio
operator holding a technician class, general, advanced, or extra class
amateur license issued by the federal communications commission,
****
without
first securing a permit so to do from the director of the department of
state police upon application as he or she may prescribe, shall be
guilty of a misdemeanor, punishable by imprisionment in the county jail
for not more than 1 year, or by a fine of not more than $500,00, or by
both fine and imprisionment in the discretion of the court.

Minnesota Scanner Law

s. 299C.37:

"No persons, other than peace officers within the state, members of
the State Patrol,
****
or persons holding a valid Amateur Radio License
issued by the Federal Communications Commission,
****
shall equip any motor vehicle with equipment, or combination of
equipment, capable of receiving any message or signal from any police
emergency frequency without permission from the Superintendent (of the
Bureau of Criminal Apprehension) to do so."

West's Minnesota Statutes Annotated, 1994
Television and Radio/Crimes and Offenses
299C.37, pp. 544-5

There may well be states that do ban mobile scanner use by hams, but I think the above references show that, in fact, many of these laws do exempt hams from anti-mobile-scanner laws.
All of the above references come from:
http://www.afn.org/~afn09444/scanlaws/
and were compiled by Todd L. Sherman (thanks, Todd.)

See, now - actually looking at the laws wasn't really that bad, now was it?

-Will Flor wgf@geocities.com

3662. Huge shootout in Los Angeles

Newsgroup: rec.radio.scanner
Date: 1997-02-28 00:00:00 UTC
From: hh357@aol.com
Message-ID: <19970228221801.RAA24591@ladder02.news.aol.com>

Eight policemen and 5 civilians were injured in a shootout with Heavily armed bank robbers. Five of the policemen and 1 civilian were shot.

Two of the four suspects were killed by police, one with a bullet through the head on live TV. (that will probably be edited out of the evening news!)

The robbers had REAL full auto weapons, not the media classifying semi autos as full auto. They had AK47's and perhaps an H&K . They acted very calm considering.

I've never heard of so many watch commanders being in the same place at one time before.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I can't find my BC100XL schematic just now, but the Uniden 800XLT
uses a 470K, 1/4 watt resistor from the center pin of the
antenna jack(s) to ground. Typically, this high value
resistor is used to prevent a buildup of static electricity
on the antenna which would damage the first mixer.

I suspect the 100 ohm resistor you substituted is
degrading the sensitivity of your scanner.

Let's review. It's against the law to have full automatic weapons in
public places. This law's effectiveness is demonstrated by incidents
like the above. It's also against the law to quietly listen to
cellular phone calls in the privacy of your own home. Wonder how
effective they expect that law to be, hmm?

I wouldn't worry too much about that. It there was a local paging transmitter interfering with the data channel, and it caused enough interference to prevent the decoding of the data channel, it would probably disrupt the normal operation of the legitimate trunk radio handsets.

If that were happening, most of the conversations on the system would be people complaining to other users about their radios. (ie "This hunk of crap! It don't work worth a damm!"
"Ya, my radio keeps losing calls too...")

I've just about given up on this one. The interface circut is perfect.
Pages 98% copy.
MDT's just the same 000's or random hash. Ideas, anyone?

MD

3669. LA MAYOR FAVORS GUN CONTROL

Newsgroup: rec.radio.scanner
Date: 1997-02-28 00:00:00 UTC

Interviewed during the recent (on-going) failed bank robbery, L.A. Mayor Reardon said that is was a good reason for banning assault weapons. Does this make sense? These pukes were NOT gun collectors, or hunters, and certainly did not belong to the NRA. These guys were BAD GUYS!!!! Make guns illegal?? Sure, , , it will make a difference, , , the bad guys won't get guns anymore, , ,, NOT!. What is Reardon thinking?? How will a law make any difference to these assholes? Will we be any safer? NO, of course not. The 2nd Amendment to the Constitution says, , "The right of citizens to keep and bear arms shall NOT BE INFRINGED"! What part of this don't they understand?

Sorry for my blurting out, but damitall, , , Dumb statements like this make my blood boil.

Does any of this sound familiar with relation to scanners?

Now, , , back to scanning the radio waves. At least for now

Try this link:

http://www.demon.co.uk/javiation/index.html

The comment that this is a good SECOND scanner is right on the money.
It is not as easy to operate as, for example, a Radio Shack/Bearcat
scanner, but it's size makes up for that. It definitely fills a niche
in the scanning hobby! It is actually the STANDARD AX-400 as it is sold
in Japan, but in the UK, Diamond Antenna markets the unit as the WELZ
WS-1000. It is unavailable in the US at present.

Yep!

If you would take your head out of your ass and look at the original
message you would see that I was not calling the cop that gave me the
ticket POWER HAPPY. I was stating the cop in the message that the other
guy wrote was POWER HAPPY. Dumb ass.
